# 1 Scope

The present document specifies the Information Model and Solution Set for the Network Resource Model (NRM) definitions of NR, NG-RAN, 5G Core Network (5GC) and network slice, to fulfil the requirements identified in 3GPP TS 28.540 [10].

The Information Model defines the semantics and behaviour of information object class attributes and relations visible on the management interfaces in a protocol and technology neutral way. And Solution Set defines one or more solution set(s) with specific protocol(s) according to the Information Model definitions.

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

#### 4.3.4.4 Notifications

### 4.3.5 NRCellDU

#### 4.3.5.1 Definition

This IOC represents the information of a cell known by DU. The procedure for cell setup is initiated from the DU, thus requiring a notion of a cell. The DU owns the resources realizing the cell, thus requiring a notion of a cell owning the specific resources instances.

The nCGI attribute, holding the NR Cell Global identifier (NCGI), see subclause 8.2 of TS 38.300 [3], serves as the 'link' between this IOC instance and a NRCellCU IOC instance holding the same NCGI in its nCGI attribute.

An NR cell transmits SS/PBCH block and always requires downlink transmission at a certain carrier frequency with a certain channel bandwidth. Transmission may be performed from multiple sector-carriers using different transmission points, and these may be configured with different carrier frequencies and channel bandwidths, as long as they are aligned to the cell's downlink resource grids as defined in subclause 4.4 in TS 38.211 [32]. The values of arfcnDL and bsChannelBwDL attributes define the resource grids which each sector-carrier needs to be aligned to. See TS 38.104, subclauses 5.3 and 5.4.2 for definitions of BS channel bandwidth and NR-ARFCN, respectively.

An NR cell requires an uplink in order to provide initial access. In case of TDD, the values of arfcnUL and bsChannelBwUL must always be set to the same values as for the corresponding DL attributes. For both FDD and TDD, the arfcnUL and bsChannelBwUL define uplink resource grids to which each sector-carrier needs to align to.

An NR cell can in addition be configured with a supplementary uplink, which has its own arfcnSUL and bsChannelBwSUL, which define resource grids for supplementary uplink sector-carriers.

Each of downlink, uplink and supplementary uplink (if configured) need an initial bandwidth part (BWP), which defines resources to be used by UEs during and immediately after initial access. Additional BWPs can be either configured or calculated by gNB internally and be applied to UEs dynamically by gNB based on e.g. UE capability and bandwidth need of each UE.

### 4.3.5.4 Notifications

## 4.3.6 NRSectorCarrier

### 4.3.6.1 Definition

This <<IOC>>NRSectorCarrier represents the resources of each transmission point included in the cell. These in general have different physical locations (of the antennae), and possibly different frequencies or bandwidths. The UE is not directly aware of which NRSectorCarrier resources the network uses for its connection.

An NR sector-carrier can have downlink, uplink or both as specified by txDirection. Attributes related to unavailable direction (DL or UL) shall not be set.

Additional NRSectorCarriers not directly associated to one cell only can also be configured.

If a value of arfcnDL, arfcnUL, bsChannelBwDL or bsChannelBwUL can be derived unambiguously from the referring cell, then that attribute needs not be present. That will not be possible if the NRSectorCarrier is used for supplementary uplink, if it is not directly associated to a cell, or if the sector-carrier uses only a part of the cell's channel bandwidth. Thus, at least in those cases the applicable attributes **must** be present and their values need to be set.

## Annex A (normative): Cell state handling

### A.1 Relation between the administrative state and the "Pre-operation state of the gNB-DU Cell"

The administrative state indicates the permission to use or prohibition against using the cell, imposed through the OAM services. The administrative state has three values: "LOCKED", "SHUTTING DOWN" or "UNLOCKED"

The meanings of these values are defined in ITU-T Recommendation X.731 [18].

The relation between the administrative state and the "Pre-operation state of the gNB-DU Cell" is defined in subclause 8.5 of TS 38.401 [4]. See below an extract from subclause 8.5 of TS 38.401 [4] on the F1 startup and cell activation.

If the `operationalState` is "ENABLED" (i.e. the resource is physically installed and working) and if the `administrativeState` is "UNLOCKED", the step "0: Pre-operational state" will exit and the step "1: F1 Setup Request" will be executed."

#### 8.5 F1 Startup and cells activation

This function allows to setup the F1 interface between a gNB-DU and a gNB-CU and it allows to activate the gNB-DU cells.

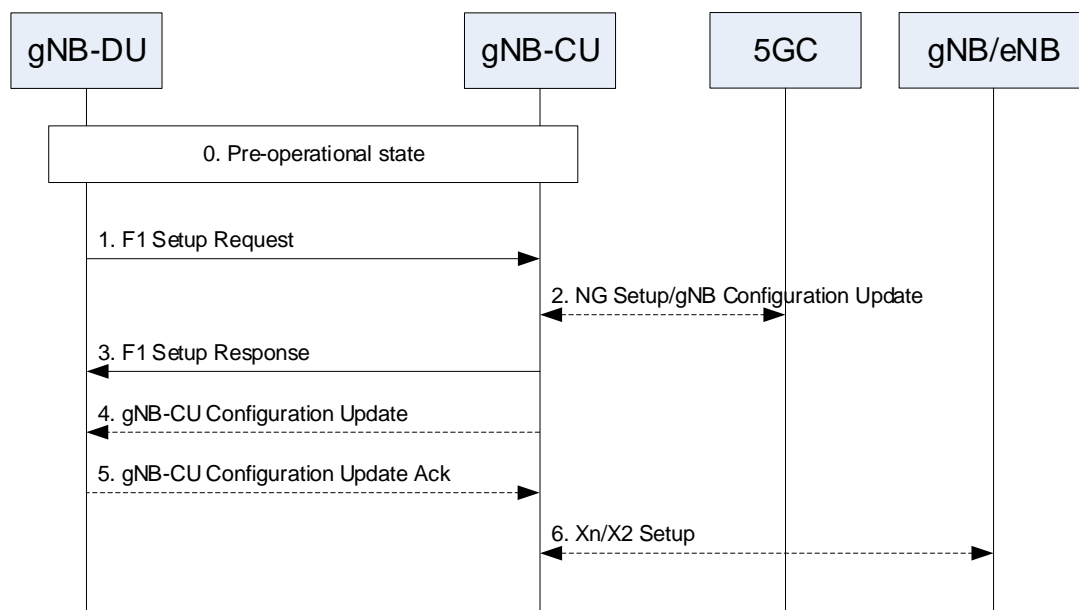

Figure 8.5-1: F1 startup and cell activation

### A.2 Combined state diagram for gNB cell

This is the Combined state diagram for gNB cell.

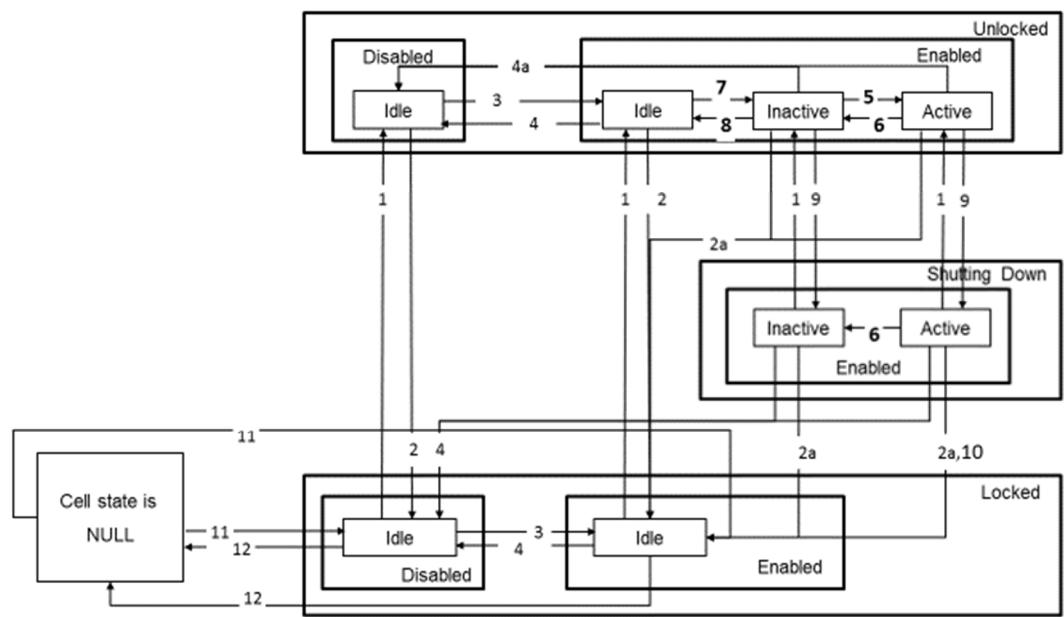

Figure A.2-1: Combined gNB cell state diagram

The gNB-DU maintains cell states. The following table is the gNB cell state transition table.

In 3-split and 2-split deployment scenarios, the interactions between gNB-CU and gNB-DU are standardized. The interactions specified under the column "The state transition events and actions" of "The gNB Cell state transition table" below **must** be present for the state transition.

In the non-split deployment scenarios, the interactions between gNB-CU and gNB-DU are not standardized. The interactions between gNB-CU and gNB-DU specified under the column "The state transition events and actions" of "The gNB Cell state transition table" can be replaced by other means that is not standardized.

## Annex B (normative):

### B.1 NSI state handling

An NSI is a logical object in the management system that represents a complex grouping of resources that may be in various states. At any time, the management system needs to know the state of an NSI.

The ITU-T X.731 [18], to which [17] refers, has defined the inter-relation between the administrative state, operational state and usage state of systems in general.

**Figure B.1: Combined NSI state diagram**

In an NSI deployment scenario, the interactions between communication service management function, network slice management function and network slice subnet management function are standardized. The interactions specified under the column "The state transition events and actions" of "NSI state transition table" below **must** be present for the state transition.

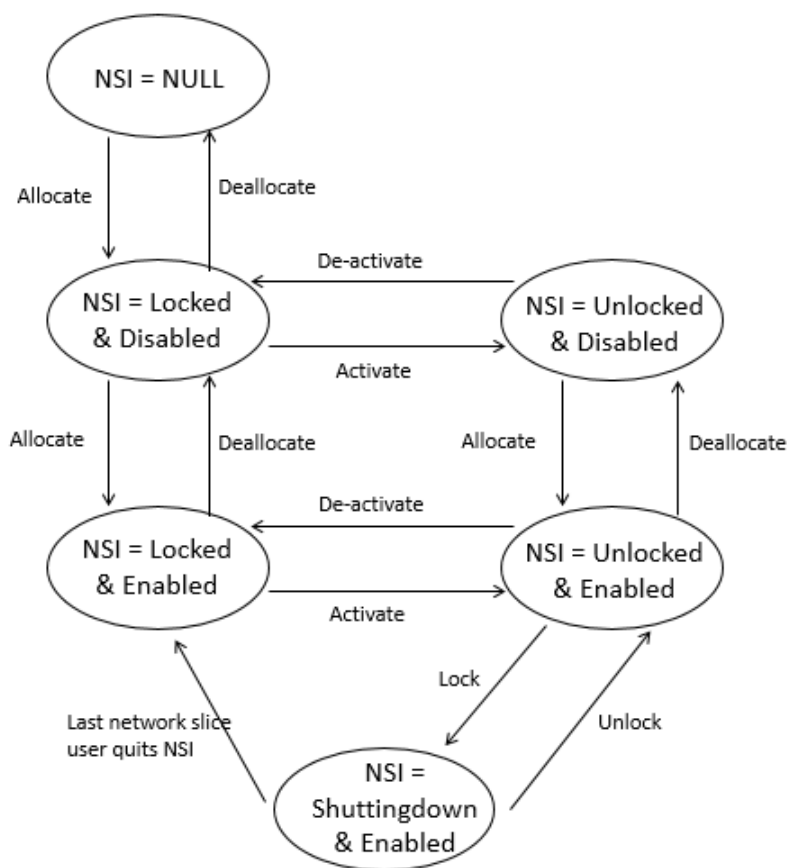

Figure B.2: NSI state diagram with state transition triggers

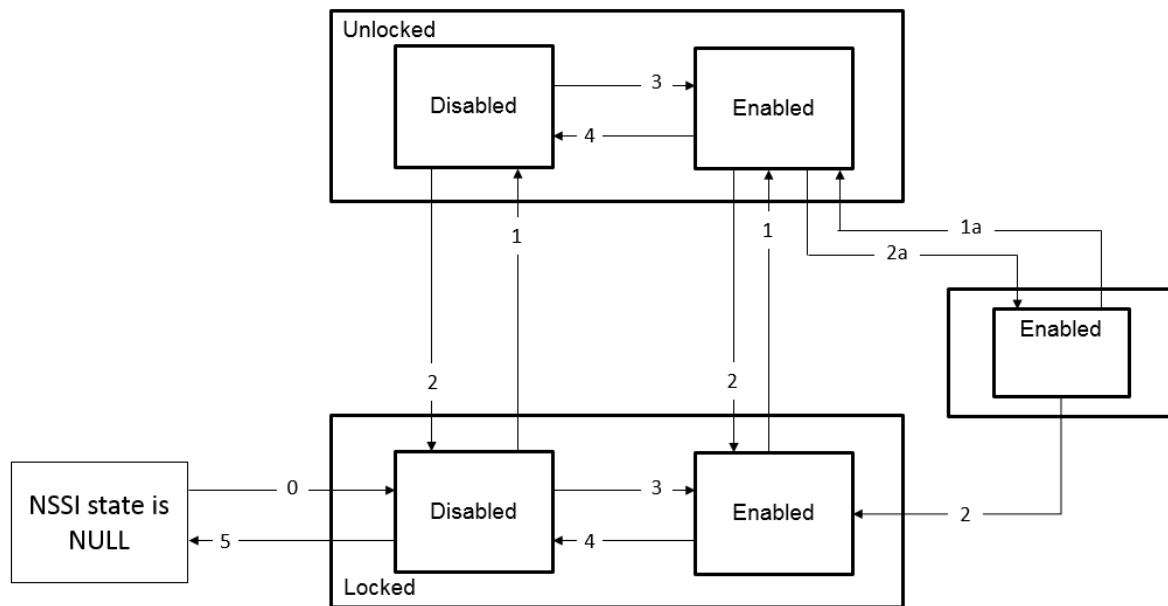

Table B.1: The NSI state transition table

Trigger number	The state transition events and actions
0	NSMF responds positively to the "Create NSI request" message, the NSI is created and the state is set to Locked
1	NSMF responds positively to the "Activate NSI request" message (identifying the NSI to be activated). ----- or ----- CM operation to set administrative state to Unlocked.
1a	CM Operation to set administrative state to Unlocked
2	The last user of the NSI stops using the NSI
2a	CM Operation to set administrative state to Shutting down

4	When the NSI or its constituents are not installed or not working NSMF receives positive response to the "Deallocate NSSI" message (applicable to the NSI to be disabled)
5	NSMF responds positively to the "Deallocate NSI request" message, the NSI is deleted and the state is set to NULL

## Annex C (normative): XML definitions for NR NRM

### C.1 General

This annex contains the XML definitions for the NR and NG-RAN NRM, in accordance with NR and NG-RAN NRM Information Model definitions specified in clause 4.

---

### C.2 Architectural features

The overall architectural feature of NR NRM information model is specified in clause 4, this clause specifies features that are specific to the Schema definitions.

The XML definitions of the present document specify the schema for a configuration content, which can be included in a configuration file for Bulk configuration management operations

---

### C.3 Mapping

#### C.3.1 General mapping

An IOC maps to an XML element of the same name as the IOC's name in the Information Model. An IOC attribute maps to a sub-element of the corresponding IOC's XML element, and the name of this sub-element is the same as the attribute's name in the Information Model.

#### C.3.2 Information Object Class (IOC) mapping

The mapping is not present in the current version of the present document.

---

### C.4 Solution Set definitions

#### C.4.1 XML definition structure

The overall description of the file format of configuration data XML files is provided by 3GPP TS 32.616 [33].

The present document defines the NRM-specific XML schema nrNrm.xsd for the NR NRM Information Model defined in clause 4.

## D.4 Solution Set definitions

### D.4.1 JSON definition structure

JSON is used as resource representations format carried in the HTTP request and HTTP response message bodies. The properties (key-value pairs) on an object are defined using the properties keyword.

### D.4.2 Graphical representation

The graphical representation is not present in the current version of the present document.

### D.4.3 JSON schema "nrNrm.json"

## Annex E (normative): YANG definitions for NR NRM

### E.1 General

This annex contains the YANG definitions for the NR and NG-RAN NRM, in accordance with NR and NG-RAN NRM information model definitions specified in clause 4.

### E.2 Architectural features

### E.3 Mapping

#### E.3.1 IOC mapping

Mapping from the IOCs defined in the information model to SS equivalent definitions are listed in the following table.

IOC Name	YANG definitions' Name	YANG Type
ManagedElement	ManagedElement	Container in module
GNBDUFunction	GNBDUFunction	Container in submodule
GNBCUCPFunction	GNBCUCPFunction	Container in submodule
GNBCUUPFunction	GNBCUUPFunction	Container in submodule
NRCellCU	NRCellCU	Container in submodule
NRCellDU	NRCellDU	Container in submodule
NRSectorCarrier	NRSectorCarrier	Container in submodule
EP_E1	EP_E1	Container in module
EP_XnC	EP_XnC	Container in module
EP_XnU	EP_XnU	Container in module
EP_NgC	EP_NgC	Container in module
EP_NgU	EP_NgU	Container in module
EP_F1C	EP_F1C	Container in module
EP_F1U	EP_F1U	Container in module
EP_S1U	EP_S1U	Container in module
EP_X2C	EP_X2C	Container in module
EP_X2U	EP_X2U	Container in module

Notes:

1. Modularize (include module and submodules) the data model design to be easier to maintain and extend.
2. Facilitate the reusability. Technically use grouping statement of YANG to define common node.
3. The YANG definitions' Name is identical to object's name in information model.
4. Define a ngran module which included/imported other modules/submodules to constitute a completed NG-RAN system. The module augments the ManagedElement IoC to add required ManagedFunctions.
5. Reflect the class hierarchy in Inheritance view. Define basic IoCs such as Top, ManagedFunction, EP\_RP, etc., and inherit xxxFunction, EP\_xxx, etc., from the parent IoCs.

PS: To simplify, only define common IoC in 28.622 as base class, and integrate attributes of common IoCs in 28.620 into the common classes.

#### E.3.2 Attributes mapping

Mapping from the attributes of IOCs defined in the information model to SS equivalent definitions are listed in the following table.

Object Attributes	YANG definitions' Name	YANG Type
Simple Type Attributes	Same to the Name in Stage 2	leaf
Complex Type Attribute	Same to the Name in Stage 2	Reusable Container
Simple Type List	Same to the Name in Stage 2 with removing List/s at the end of the attribute	leaf-list
Complex Type List	Same to the Name in Stage 2 with removing List/s at the end of the attribute	list

**NOTES:** Basically, use Leaf to define Attributes, and use typedef/grouping to define specific/complex type if required.

## F.3 Mapping

### F.3.1 General mapping

An IOC maps to an XML element of the same name as the IOC's name in the Information Model. An IOC attribute maps to a sub-element of the corresponding IOC's XML element, and the name of this sub-element is the same as the attribute's name in the Information Model.

### F.3.2 Information Object Class (IOC) mapping

The mapping is not present in the current version of the present document.

## F.4 Solution Set definitions

### F.4.1 XML definition structure

The overall description of the file format of configuration data XML files is provided by 3GPP TS 32.616 [33].

The present document defines the NRM-specific XML schema `ngcNrm.xsd` for the 5GC NRM Information Model defined in clause 4.

XML schema `ngcNrm.xsd` explicitly declares NRM-specific XML element types for the related NRM.

The definition of those NRM-specific XML element types complies with the generic mapping rules defined in 3GPP TS 32.616 [33].

### F.4.2 Graphical representation

The graphical representation is not present in the current version of the present document.

### F.4.3 XML schema "`ngcNrm.xsd`"

## G.4 Solution Set definitions

### G.4.1 JSON definition structure

JSON is used as resource representations format carried in the HTTP request and HTTP response message bodies. The properties (key-value pairs) on an object are defined using the properties keyword.

### G.4.2 Graphical representation

The graphical representation is not present in the current version of the present document.

### G.4.3 JSON schema "ngcNrm.json"

NWDAFFunction	NWDAFFunction	Container in submodule
EP_***	EP_***	Reusable container in module

### H.3.2 Attributes mapping

Mapping from the attributes of IOCs defined in the information model to SS equivalent definitions are listed in the following table.

Object Attributes	YANG definitions' Name	YANG Type
Simple Type Attributes	Same to the Name in Stage 2	leaf
Complex Type Attribute	Same to the Name in Stage 2	Reusable Container
Simple Type List	Same to the Name in Stage 2 with removing List/s at the end of the attribute	leaf-list
Complex Type List	Same to the Name in Stage 2 with removing List/s at the end of the attribute	list

# Annex I (normative): XML definitions for network slice

## I.1 General

This annex contains the XML definitions for the network slice NRM, in accordance with network slice NRM Information Model definitions specified in clause 6.

---

## I.2 Architectural features

The overall architectural feature of network slice information model is specified in clause 6, this clause specifies features that are specific to the Schema definitions.

The XML definitions of the present document specify the schema for a configuration content, which can be included in a configuration file for Bulk configuration management operations.

---

## I.3 Mapping

### I.3.1 General mapping

An IOC maps to an XML element of the same name as the IOC's name in the Information Model. An IOC attribute maps to a sub-element of the corresponding IOC's XML element, and the name of this sub-element is the same as the attribute's name in the Information Model.

### I.3.2 Information Object Class (IOC) mapping

The mapping is not present in the current version of the present document.

---

## I.4 Solution Set definitions

### I.4.1 XML definition structure

The overall description of the file format of configuration data XML files is provided by 3GPP TS 32.616 [33].

This annex defines the NRM-specific XML schema sliceNrm.xsd for the network slice Information Model defined in clause 6.

XML schema sliceNrm.xsd explicitly declares NRM-specific XML element types for the related NRM.

The definition of those NRM-specific XML element types complies with the generic mapping rules defined in 3GPP TS 32.616 [33].

### I.4.2 Graphical representation

The graphical representation is not present in the current version of the present document.

### I.4.3 XML schema "sliceNrm.xsd"

## J.4 Solution Set definitions

### J.4.1 JSON definition structure

JSON is used as resource representations format carried in the HTTP request and HTTP response message bodies. The properties (key-value pairs) on an object are defined using the properties keyword.

### J.4.2 Graphical representation

The graphical representation is not present in the current version of the present document.
