Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee Methods for Testing and Specification (MTS).

The present document is part 3 of a multi-part deliverable covering Conformance Test Specification for SIP (IETF RFC 3261), as identified below:

- Part 1: "Protocol Implementation Conformance Statement (PICS) proforma";
- Part 2: "Test Suite Structure and Test Purposes (TSS&TP)";
- Part 3: "Abstract Test Suite (ATS) and partial Protocol Implementation eXtra Information for Testing (PIXIT) proforma".

1 Scope

The present document specifies the Abstract Test Suite (ATS) for the Session Initiation Protocol SIP as defined in RFC 3261 [1].

The objective of the present document is to provide a basis for conformance tests for SIP equipment giving a high probability of inter-operability between different manufacturer's SIP equipments.

Annex A provides the Tree and Tabular Combined Notation (TTCN-3) part of the ATS.

Annex B provides the Partial Protocol Implementation Extra Information for Testing (PIXIT) Proforma of the ATS.

Annex C provides the Protocol Conformance Test Report (PCTR) Proforma of the ATS.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication and/or edition number or version number) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in RFC 3261 [1], ES 201 873-1 [2] and ES 201 873-5 [3] apply.

3.2 Abbreviations

For the purposes of the present document, the abbreviations given in ES 201 873-1 [2], ES 201 873-5 [3], RFC 3261 [1] and the following apply:

4 Abstract Test Method (ATM)

This clause describes the ATM used to test Draft IETF SIP RFC as defined in RFC 3261 [1].

4.1 Network architecture

The basic SIP network architecture is defined in figure 1. The ATS defines test cases for the IUT being in the role of each displayed entity.

Figure 1: SIP network architecture

4.2 Protocol architecture

The Implementation Under Test (IUT) for which this test case specification applies consists of the SIP protocol (see figure 2).

Figure 2: SIP protocol architecture

4.3 Test System architecture

Test systems that implement this ATS shall conform to the requirements as defined in this clause.

4.3.1 Structure

An abstract architecture for a Test System (TS) implementing a TTCN-3 ATS is displayed in figure 3 and also stated in TRI

Figure 3: Abstract Test System architecture

A TS has two interfaces, the TTCN-3 Control Interface (TCI) and the TTCN-3 Runtime Interface (TRI), which specify the interface between Test Management (TM) and TTCN-3 Executable (TE) entities, and TE, SUT Adapter (SA) and Platform Adapter (PA) entities, respectively. Out of these two interfaces the TRI has been standardized in ES 201 873-5 [3], whereas the specification and implementation of the TCI is currently considered to be proprietary.

The part of TS that deals with interpretation and execution of TTCN-3 modules, i.e. the Executable Test Suite (ETS), is shown as part of the TTCN-3 Executable (TE). This ETS corresponds either to the executable code produced by a TTCN-3 compiler or a TTCN-3 interpreter from the TTCN-3 ATS in a TS implementation. The remaining part of the TS, which deals with any aspects that cannot be concluded from information being present in the TTCN-3 ATS alone, can be decomposed into Test Management (TM), SUT Adapter (SA), and Platform Adapter (PA) entities. In general, these entities cover a TS user interface, test execution control, test event logging, communication of test data with the SUT, and timer implementation.

The SA for a SIP TS shall implement the TRI adaptation as well as the SIP transport protocol architecture described in clause 4.2. The Encoding/Decoding System (EDS) entity with the TE and Test Logging (TL) entity within the TM shall comply with the conventions defined in following clauses.

4.3.2 Encoding/Decoding System requirements

SIP is a text-based protocol that allows different syntactical presentations of the same information. In general, an implementation of this ATS should use a EDS to parse received encoded messages into TTCN-3 type structures and values, and encode structured TTCN-3 type structures and values into encoded messages. This EDS is not part of the ATS. Still all encoded messages, i.e. the messages as they are transmitted by the SA to or received by the SA from the SUT, shall be logged.

The following terms shall be used for the conventions defined below:

Syntactic delimiter Syntactic delimiters are characters like "=" or ";" that are used to separate encoded values.

LWS linear white spaces as defined in RFC 3261 [1].

Parameter name name of header parameters as defined in RFC 3261 [1].

Parameter value the value of a parameter as defined in RFC 3261 [1].

Undefined method an undefined method is a method other than: "INVITE", "ACK", "OPTIONS", "BYE",

"CANCEL" and "REGISTER".

Undefined header an undefined header is a header other than general-header, entity-header, request-header

and response header as defined in RFC 3261 [1].

Unexpected header an unexpected header is a header, which shall not be present in a specific request message.

This definition complies to the definition of NOT APPLICABLE in RFC 3261 [1],

section 20 for request messages.

4.3.2.1 Decoding requirements

TTCN-3 fields should not contain syntactic delimiters like white space, semicolon, equal characters etc. in fully decoded fields. Instead the information provided by a parser shall be used to build the decoded message in TTCN-3. Decoded messages shall use the TTCN-3 enumeration types where ever appropriate, e.g. for the method and the header field name.

For charstring fields the following decoding rules shall be applied by the EDS:

- 1) Subsequent LWS shall compress to a single space character " ".
- 2) Decoded parameter names shall use only lower case letters.
- 3) Parameter values containing an integer value shall be decoded to a TTCN-3 integer value where a TTCN-3 integer type is used for a SIP parameter value.

The following decoding rules shall be applied by the EDS to each received message in the following order:

- In case a request message indicating an undefined method is received by the test system, the message shall not be passed in the TE to the ETS. However the message is subject to logging as defined in clause 4.3.3 ("Logging conventions").
- 2) In case an undefined header has been received the header field shall be decoded as undefinedHeader field.

RFC 3261 [1] allows for multiple header field values of the same kind to either arrive in one or multiple occurrences of the corresponding header field. The SIP ATS has been written assuming only the first format. Therefore, should the EDS receive multiple header fields of the same kind in a SIP message, e.g. of a Via header field, it shall convert them into the equivalent single header field with multiple values. This can be achieved by adding the value of, e.g. the second received Via header field as the last value to the value(s) of the first Via header field.

4.3.2.2 Encoding requirements

Encoders shall follow all encoding rules that are defined in RFC 3261 [1] when encoding structured values received from templates. This applies in particular to but it is not restricted to section 7.3.1 of RFC 3261 [1].

Values of type RawMessage shall be send to the SUT without any modification.

4.3.3 Logging conventions

As the ATS defines on an abstract level the message exchange between TS and SUT the messages encoded messages send and received shall be logged. The TM entity in the TS shall provide access to this log.

5 Untestable Test Purposes (TP)

This clause gives a list of TP, which are not implemented in the ATS due to the chosen ATM or other restrictions:

None.

6 ATS conventions

The ATS conventions are intended to give a better understanding of the ATS, but they also describe the conventions made for the development of the ATS. These conventions shall be considered during any later maintenance or further development of the ATS.

The ATS conventions contain two clauses, the naming conventions and the implementation conventions. The naming conventions describe the structure of the naming of all ATS elements. The implementation conventions describe the functional structure of the ATS.

6.1 Naming conventions

6.1.1 Type definitions

This clause describes the naming conventions used for structured and unstructured types as well as for the field names of structured types.

6.1.1.1 General

Type identifiers use mixed cased with the first letter of each internal word capitalized.

EXAMPLE 1: RequestLine

Field identifiers use mixed cased with a lowercase first letter. Internal words start with a capital letter.

EXAMPLE 2: requestLine

Names of type as well as field identifiers attempt to follow the naming chosen of ABNF elements (if a counterpart exists) as closely as possible.

EXAMPLE 3: NameAddr hostName

In case type and identifier names should give a hint on their structure the term describing the structure should be separated with an underscore ("_") at the end of the name.

EXAMPLE 4: CommaParam_List ContactBody_Union

6.1.1.2 PDU Type Definition

Names of types used as PDUs follow the general conventions as defined in clause 6.1.1.1.

EXAMPLE: Request

6.1.2 Template definition

Template identifiers consist of the type name, an identifier denoting whether the template is for sending or receiving and a sequential number.

EXAMPLE: Request_r_1 denotes a template from type Request that is intended for reception.

CommaParam_List_s_25 denotes a template from type CommaParam_List that is intended for

sending.

The sequential number is used only to distinguish between templates for the same type and direction and includes no other information.

6.1.3 Constant declarations

Identifiers for either internal or external constants, use only uppercase letters. Internal words are separated by an underscore ("_").

EXAMPLE: SIP_VERSION

6.1.4 Enumeration declarations

While identifiers for the enumeration type follow the conventions as defined in clause 6.1.1. "Type definitions", enumerations elements use only uppercase letters, which are suffixed by "_E" to distinguish them from constants. Internal words are separated by an underscore character ("_").

EXAMPLE: Enumeration type

FieldName

Enumeration value

FROM_E

6.1.5 Module parameter declarations

Identifiers for module parameters follow the general rules as defined in clause 6.1.3. Numbers are separated from words using the underscore character "_".

EXAMPLE: CAP 1

6.1.6 Variable declarations

Identifiers for variables follow the general rules for field names as defined in clause 6.1.1. "Type definitions".

6.1.7 Function declarations

Identifiers for either internal or external functions use mixed case with a lowercase first letter. Internal words start with a capital letter, and "To" is abbreviated with "2".

EXAMPLE: char2str ()

6.1.8 Test Case declarations

6.1.8.1 General

All test cases are listed in the order in which they appear in the Test Suite Structure (TSS) and TP document. Grouping is used to reflect the TSS.

6.1.8.2 Test Case (TC) identifier

The identifier of the test case is constructed in the same way as for the test purpose described in TS 102 027-2 [8]. The identifier of a TC is built according to table 1.

Table 1: TP identifier naming convention scheme

```
Identifier:  <main functionality> <role> <functionality> <type> <nn>
   col>
                                                        SIP
   <main functionality>
                                                        Registration (RG), Session (SS),
                                                        Message Parsing (MP)
                                                        Registrant (RT), Registrar (RR)
   <role>
                                                        Originating Endpoint (OE), Terminating Endpoint (TE),
                                                        Proxy (PR), Redirect (RD)
                                                        Call Establishment (CE), Call Release(CR)
   <functionality> (optional)
                                                        Valid Behaviour (V), Invalid Behaviour (I),
   <type>
                                                        Inopportune Behaviour (O)
                                                        sequential number (001 to 999)
   <nnn>
```

If variants for one TP have been specified a lower case letter, starting with "a" has been appended to each of the variants.

EXAMPLE: SIP_RG_RT_V_001 SIP_RG_RT_V_004a SIP_RG_RT_V_004c

If more than 26 variants have been defined an additional lower case letter, starting with "a" will be appended.

6.1.9 Timer declarations

Two types of timers can be identified:

- 1) Standardized:
 - Those defined in RFC 3261 [1], e.g. T1. They use exactly the same name as in the standard.

As there is a tolerance margin accepted for these timers, three values are needed:

- The maximum value allowed, which will use the suffix "_max";
- The minimum value allowed, which will use the suffix "_min";
- The value actually implemented, with no suffix;

EXAMPLE 1: T1 _max, T1_min, and T1.

- 2) Not standardized:
 - Those not defined in the protocol standard, i.e. for execution use, e.g. a timer waiting for a response. These timers begin with the prefix "T_", followed by a string in lowercase letters.

EXAMPLE 2: T_resp represents a timer for controlling the response time of the IUT.

6.1.10 Group names

Group names follow the same general conventions as defined in clause 6.1.1.1.

EXAMPLE: SubtypesTemplateDeclarations

Where appropriate group names reflect the hierarchic group structure.

6.2 Implementation conventions

6.2.1 Type definitions

The following section gives an overview on the mapping of SIP messages and structures as defined in RFC 3261 [1] and their corresponding TTCN-3 types.

6.2.1.1 Messages

Distinct types have been defined for SIP request and response messages, as they have a different internal structure. Messages are defined as a record structure containing three fields, a request/status line field, a header field and a message body field, and a payload field which contains the whole message as it has been received in its text format. For syntactic delimiters, like Carriage Return Line Feed (CRLF), colon ":", etc. no extra fields are defined as they are already removed by the EDS.

The definition of invalid messages for sending and receiving is discussed in clause 6.2.1.1.3.

6.2.1.1.1 Request messages

For all possible valid requests one generic type has been defined.

```
EXAMPLE: The generic request message

type record SipRequest {

RequestLine requestLine,

RequestHeader reqHeader,

charstring messageBody optional,

Payload payload optional

}
```

6.2.1.1.2 Response messages

For all possible valid responses one generic type has been defined.

```
EXAMPLE: The generic response message
type record Response {
    StatusLine statusLine,
    ResponseHeader resHeader,
    charstring messageBody optional,
    Payload payload optional
}
```

6.2.1.1.3 Raw messages

For defining syntactic torture or syntactic invalid messages a distinct type RawMessage has been defined. This type is defined as a charstring. Messages using this type define exactly how the message shall be transmitted, thus giving the possibility to define the message on a character level.

```
EXAMPLE: A torture message

template RawMessage rawMessage_s_1 =

"INVITE sip:joe@foo.com SIP/2.0" & CRLF &

"TO : " & CRLF

" sip:joe@foo.com ;" & TAB & " tag = 1918181833n" & CRLF &

"Via : SIP / 2.0";
```

The RawMessage type has not been used to describe valid receiving templates. Therefore, valid receiving templates will always use structured messages.

6.2.1.2 Headers

The following clause defines the mapping of the header field section of a SIP message as defined in RFC 3261 [1].

For all message one message header type has been defined. These message header type include all possible header fields that are allowed to be present in the header section of SIP messages according to RFC 3261 [1]. As individual header fields may appear in any order in a SIP message these header types are defined as sets. Header fields which are optional in all SIP messages use the **optional** keyword.

```
EXAMPLE 1: A header structure for an SIP request.
                                type set MessageHeader
                    {
                                                       accept optional,
                          Accept
                         AcceptEncoding acceptEncoding optional,
AcceptLanguage acceptLanguage optional,
AlertInfo alertInfo optional,
Allow optional,
                          Allow
                                                       allow optional,
                          AuthenticationInfo authenticationInfo optional,
                          Authorization authorization optional,
                          CallId
                                                       callId,
                                                      callInfo optional,
                          CallInfo
                                                      contact optional,
                          Contact.
                          ContentDisposition contentDisposition optional,
                          ContentEncoding contentEncoding optional,
                         ContentLanguage contentLanguage optional,
ContentLype contentType optional,
                          CSeq
                                                       cSeq,
                                                     date optional,
                          Date
                         Date

Timestamp timestamp optional,
                                                       toField,
                                                 unsupported optional, userAgent optional,
                          Unsupported
                          UserAgent
                          warning optional,
WwwAuthenticate wwwAuthenti
                          Via
                                                       via,
                                                       wwwAuthenticate optional,
                          UndefinedHeader_List
                                                             undefinedHeader List optional
```

Each header field is substructured into record and consists of at least two fields, the fieldName and the fieldValue.

```
EXAMPLE 2: General structure of a header field type

type record HeaderField {

FieldName fieldName,

FieldValue fieldValue

}
```

The field name type is an enumeration type that contains an entry for each header field type. All enumerations are capitalized and suffixed with "_E" to distinguish enumeration values from constants.

Depending on the definition of every particular header field in the ABNF [1] and its relevance to the SIP TIPHON TP, types for header field values have been defined and substructured differently. In general, every header field value is at least structured according to its header field definition in the SIP ABNF.

```
EXAMPLE 4: A header field type with a simple header field value type like charstring:

type record Priority {

FieldName fieldName(PRIORITY_E),

charstring priorityValue
}
```

EXAMPLE 5: A header field type with a header field value consisting of multiple fields:

```
type record MimeVersion {
   FieldName fieldName,
   integer majorNumber,
   integer minorNumber
}
```

Types for header field values may, however, be further sub structured if the SIP ABNF allows.

The level of substructure is again header field dependent. Should a header field value have a potential for further substructuring (in the SIP ABNF) it is declared as a type equivalent to charstring. Note that values of the latter types still contain syntactic delimiters.

```
EXAMPLE 7: The value of the below type still contains the "@" delimiter type charstring CallidString:
```

In case a SIP header field might contain a choice of types of information unions have been used.

```
EXAMPLE 8: sub structured union field value type
type union ContactBody_Union
{
char wildcard,
ContactAddress_List contactAddress_List
}
```

The contact body can contain either a wildcard or a contact address list.

A list, i.e. the set of construct has been used for collecting information of the same type. In case the order is important the record of construct has been used. List types have been created for header fields that may have multiple occurrences of header field values as well as for parameters in header fields. To avoid multiple encodings for the same type, the naming of list types derived from generic parameters has been based on its encoding.

```
EXAMPLE 9: Collection of multiple header field values of the same type
```

```
type record Via {
   FieldName fieldName,
   ViaBody_List viaBody
}

type record of ViaBody ViaBody_List;
```

ViaBody_List contains all values of the Via header field.

EXAMPLE 10: Collection of multiple generic parameters

type set of GenericParam SemicolonParam_List;

6.2.2 Constant definitions

6.2.2.1 Constants

Syntactic delimiters for raw messages, e.g. "<", or "@" have been defined as constants.

```
EXAMPLE: const charstring AT := "@";
```

6.2.2.2 External Constants

To represent non-printable characters like horizontal tabulator or a carriage return external constants have been used.

```
EXAMPLE: \qquad \textbf{external const charstring $LF$; // the ASCII character 0x0a}\\
```

6.2.3 Module Parameters

PICS/PIXIT parameters are defined as TTCN-3 module parameters.

6.2.4 Template definitions

Modifications of templates have been used to allow focusing on the essential parts of a test message. However these mechanisms have to be checked very carefully as they can be counter intuitive.

6.2.5 Dynamic part

No conventions for the dynamic part have been defined yet.

7 PCTR conformance

A test laboratory, when requested by a client to produce a PCTR, is required, as specified in ISO/IEC 9646-5 [5], to produce a PCTR conformant with the PCTR template given in annex B of ISO/IEC 9646-5 [5].

Furthermore, a test laboratory, offering testing for the ATS specification contained in annex C, when requested by a client to produce a PCTR, is required to produce a PCTR conformant with the PCTR proforma contained in annex A.

A PCTR which conforms to this PCTR proforma specification shall preserve the content and ordering of the clauses contained in annex A. Clause A.6 of the PCTR may contain additional columns. If included, these shall be placed to the right of the existing columns. Text in italics may be retained by the test laboratory.

8 PIXIT conformance

A test realizer, producing an executable test suite for the Abstract Test Suite (ATS) specification contained in annex C, is required, as specified in ISO/IEC 9646-4 [4], to produce an augmented partial PIXIT proforma conformant with this partial PIXIT proforma specification.

An augmented partial PIXIT proforma which conforms to this partial PIXIT proforma specification shall, as a minimum, have contents which are technically equivalent to annex B. The augmented partial PIXIT proforma may contain additional questions that need to be answered in order to prepare the Means Of Testing (MOT) for a particular Implementation Under Test (IUT).

A test laboratory, offering testing for the ATS specification contained in annex C, is required, as specified in ISO/IEC 9646-5 [5], to further augment the augmented partial PIXIT proforma to produce a PIXIT proforma conformant with this partial PIXIT proforma specification.

A PIXIT proforma which conforms to this partial PIXIT proforma specification shall, as a minimum, have contents which are technically equivalent to annex B. The PIXIT proforma may contain additional questions that need to be answered in order to prepare the test laboratory for a particular IUT.

9 ATS Conformance

The test realizer, producing a Means Of Testing (MOT) and Executable Test Suite (ExTS) for the present document, shall comply with the requirements of ISO/IEC 9646-4 [4]. In particular, these concern the realization of an Executable Test Suite (ExTS) based on each ATS. The test realizer shall provide a statement of conformance of the MOT to the present document.

An ExTS which conforms to the present document shall contain test groups and test cases which are technically equivalent to those contained in the ATS in annex C. All sequences of test events comprising an abstract test case shall be capable of being realized in the executable test case. Any further checking which the test system might be capable of performing is outside the scope of the present document and shall not contribute to the verdict assignment for each test case.

Test laboratories running conformance test services using this ATS shall comply with ISO/IEC 9646-5 [5].

A test laboratory which claims to conform to this ATS specification shall use an MOT which conforms to this ATS.

Annex A (normative): Abstract Test Suite (ATS)

A.1 The ATS in TTCN-3 core (text) format

This ATS has been produced using the Testing and Test Control Notation (TTCN) according to ES 201 873-1 [2].

The TTCN-3 core (text) representation corresponding to this ATS is contained in an ASCII files (SIP_Steps.ttcn, SIP_MainModule.ttcn, SIP_Templates.ttcn and SIP_TypesAndConf.ttcn contained in archive ts_10202703v030201p0.zip) which accompanies the present document.

NOTE: Where an ETSI Abstract Test Suite (in TTCN-3) is published in both core and tabular format these two forms shall be considered equivalent. In the event that there appears to be syntactical or semantic differences between the two then the problem shall be resolved and the erroneous format (whichever it is) shall be corrected.

Annex B (normative): Partial PIXIT proforma

Notwithstanding the provisions of the copyright clause related to the text of the present document, ETSI grants that users of the present document may freely reproduce the PIXIT proforma in this annex so that it can be used for its intended purposes and may further publish the completed PIXIT.

The PIXIT Proforma is based on ISO/IEC 9646-6 [6]. Any needed additional information can be found in there.

Table B.7: IP parameters

Name	Туре	Comments	Value
PX_UDP	boolean	True if UDP transport is used by the IUT	Yes
		(NOTE: TCP is currently not supported in	
		this SIP ATS, so that this PIXIT value shall	
		always be Yes)	
PX_TRANSPORT	charstring	Used transport in uppercase "UDP" / "TCP"	
PX_IUT_PORT	integer	Default port number used by the IUT to	
		exchange SIP messages	
PX_IUT_IPADDR	charstring	Default IP address used by the ETS to	
		exchange SIP messages	
PX_IUT_PORT2	integer	Default port number used by the IUT to	
		exchange SIP messages on PTC side	
PX_IUT_IPADDR2	charstring	Default IP address used by the IUT to	
		exchange SIP messages on PTC side	
PX_ETS_PORT	integer	Default port number used by the ETS to	
		exchange SIP messages on MTC side	
PX_ETS_IPADDR	charstring	Default IP address used by the IUT to	
		exchange SIP messages on MTC side	
PX_ETS_PORT2	integer	Default port number used by the ETS to	
		exchange SIP messages on PTC1 side	
PX_ETS_IPADDR2	charstring	Default IP address used by the IUT to	
		exchange SIP messages on PTC1 side	
PX_ETS_PORT3	integer	Default port number used by the ETS to	
		exchange SIP messages on PTC2 side	
PX_ETS_IPADDR3	charstring	Default IP address used by the IUT to	
		exchange SIP messages on PTC2 side	
PX_PROXY_PORT	integer	Default port number used in 305 "Use Proxy"	
		message	
PX_PROXY_IPADDR	charstring	Default IP address used in 305 "Use Proxy"	
		message	

Table B.8: Registration parameters

Name	Туре	Comments	Value
PX_DELTA_REGISTRATION	charstring	delta-seconds used in expires header field in 200 OK message to answer REGISTRATION request	
PX_ETS_LOCAL_DOMAIN	charstring	identity of the tester local domain on MTC side	
PX_ETS_LOCAL_USER	charstring	identity of the tester local user on MTC side	
PX_ETS_LOCAL_DOMAIN2	charstring	identity of the tester local domain on MTC or PTC side	
PX_ETS_LOCAL_USER2	charstring	identity of the tester local user on PTC side	
PX_HOME_REGISTRATION	boolean	IUT needs to register itself to its home register first	
PX_PR_MTC_REGISTRATION	boolean	True if the ETS shall register itself before running proxy test cases on MTC side	_
PX_PR_PTC_REGISTRATION	boolean	True if the ETS shall register itself before running proxy test cases on PTC side	

Table B.9: Roaming parameters

Name	Type	Comments	Value
PX_ETS_LOCAL_THIRD_USER	charstring	identity of another tester local user	
		(third party tester)	

Table B.10: Session parameters

Name	Туре	Comments	Value
PX_TE_CALLEE_DOMAIN	charstring	hostname of the callee when IUT is the callee	
PX_TE_CALLEE_USERINFO	charstring	userinfo of the callee when IUT is the callee	
PX_UNKNOWN_DOMAIN	charstring	unknown hostname when IUT is the callee	
PX_UNKNOWN_USERINFO	charstring	unknown userinfo when IUT is the callee	
PX_UNAUTHORIZED_USER	charstring	Identity of the tester local user on MTC side, which is not authorized to update registration	

Table B.11: Header parameters

Name	Туре	Comments	Value
PX_CREDENTIALS	credentials	Value used in authorization header	
		in REGISTER sent to the IUT	
PX_STR_CREDENTIALS	charstring	String Value used in authorization	
		header in REGISTER sent to the IUT	
		for MG group	
PX_REALM	charstring	realm value understood by the IUT	
PX_CONTENCOD_UNSUPPORTED	charstring	Content encoding mechanism that is	
		not supported by the IUT	
PX_OPTION_UNSUPPORTED	charstring	Option set in Request header field	_
		that is not supported	

Table B.12: Body parameters

Name	Туре	Comments	Value
PX_SDPBODY	charstring	SDP parameter proposed by the ETS	
PX_SDPBODY2	charstring	additional SDP parameter proposed by the ETS	
PX_SDPBODY_UNSUPPORTED	charstring	SDP parameter proposed by the ETS that is not supported by the IUT	
PX_SDPBODY_65535	charstring	SDP parameter proposed by the ETS that makes the 200 OK or INVITE request of 63,535 bytes long	
PX_SDPBODY_TOO_LARGE	charstring	SDP parameter proposed by the that makes the 200 OK or INVITE request too large	

Table B.13: Timers

Name	Туре	Comments	Value
PX_T1	float	T1 RTT estimate (500 ms)	
PX_T2	float	T2 maximum retransmit interval for	
		non-invite requests and invite responses	
		(4 000 ms)	
PX_T4	float	Maximum duration a message will remain	
		in the network (5 000 ms)	
PX_TWAIT	float	TWait default value for waiting an operator	
		action	
PX_TACK	float	default value for waiting an	
		acknowledgement	
PX_TRESP	float	TResp default value for waiting for a	
		response from the IUT	
PX_TNOACT	float	value for waiting no message from the	
		IUT. Default value for waiting no message	
		from the IUT.	
		The given value should be less than value	
		of SHORT_REGISTRATION constant	
		(which is currently "3" (seconds))	
PX_TSYNC	float	default value to synchronize ptc	
PX_TGUARD	float	default value for an extra long timer to limit	
		test execution	

Table B.14: Authentication parameters

Name	Туре	Comments	Value
PX_REGISTRATION_AUTHEN TICATION_ENABLED	boolean	True if authentication is enabled for registration messages	
PX_RFC2617_QOP	charstring	Quoted string of one or more tokens indicating the "quality of protection" values supported by the server. The value "auth" indicates authentication; the value "auth-int" indicates authentication with integrity protection. EXAMPLE: "auth, auth-int".	
PX_RFC2617_USERNAME	charstring	The name of user in the specified realm.	
PX_RFC2617_PASSWD	charstring	Password of USERNAME.	
PX_RFC2617_URI	charstring	URI	

Annex C (normative): PCTR proforma

Notwithstanding the provisions of the copyright clause related to the text of the present document, ETSI grants that users of the present document may freely reproduce the PCTR proforma in this annex so that it can be used for its intended purposes and may further publish the completed PCTR.

The PCTR proforma is based on ISO/IEC 9646-6 [6]. Any needed additional information can be found in there.

C.1.5 Comments Additional comments may be given by either example, to note disagreement between the	er the client or the test laboratory on any of the contents of the PCTR, for two parties.

C.2 IUT Conformance status

This IUT has or has not been shown by conformance assessment to be non conforming to the specified protocol specification.

Strike the appropriate words in this sentence. If the PICS for this IUT is consistent with the static conformance requirements (as specified in clause D.3) and there are no "FAIL" verdicts to be recorded (in clause D.6) strike the words "has or", otherwise strike the words "or has not".

C.3 Static conformance summary

The PICS for this IUT is or is not consistent with the static conformance requirements in the specified protocol.

Strike the appropriate words in this sentence.

C.4 Dynamic conformance summary

The test campaign did or did not reveal errors in the IUT. Strike the appropriate words in this sentence. If there are no "FAIL" verdicts to be recorded (in clause D.6t) strike the words "did or" otherwise strike the words "or did not". Summary of the results of groups of test: Static conformance review report If clause D.3 indicates non-conformance, this clause itemizes the mismatches between the PICS and the static conformance requirements of the specified protocol specification.
