## **Foreword**

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

In the present document, modal verbs have the following meanings:

shall indicates a mandatory requirement to do somethingshall not indicates an interdiction (prohibition) to do something

The constructions "shall" and "shall not" are confined to the context of normative provisions, and do not appear in Technical Reports.

The constructions "must" and "must not" are not used as substitutes for "shall" and "shall not". Their use is avoided insofar as possible, and they are not used in a normative context except in a direct citation from an external, referenced, non-3GPP document, or so as to maintain continuity of style when extending or modifying the provisions of such a referenced document.

**should** indicates a recommendation to do something

**should not** indicates a recommendation not to do something

may indicates permission to do something

**need not** indicates permission not to do something

The construction "may not" is ambiguous and is not used in normative elements. The unambiguous constructions "might not" or "shall not" are used instead, depending upon the meaning intended.

can indicates that something is possiblecannot indicates that something is impossible

The constructions "can" and "cannot" are not substitutes for "may" and "need not".

will indicates that something is certain or expected to happen as a result of action taken by an agency

the behaviour of which is outside the scope of the present document

will not indicates that something is certain or expected not to happen as a result of action taken by an

agency the behaviour of which is outside the scope of the present document

might indicates a likelihood that something will happen as a result of action taken by some agency the

behaviour of which is outside the scope of the present document

might not indicates a likelihood that something will not happen as a result of action taken by some agency

the behaviour of which is outside the scope of the present document

In addition:

is (or any other verb in the indicative mood) indicates a statement of fact

is not (or any other negative verb in the indicative mood) indicates a statement of fact

The constructions "is" and "is not" do not indicate requirements.

# 1 Scope

The present document establishes the minimum RF requirements for NR User Equipment (UE) Interworking operation with other radios. This includes but is not limited to additional requirements for carrier aggregation or NR dual connectivity between Range 1 and Range 2 and additional requirements due to NR non-standalone (NSA) operation mode with E-UTRA.

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

# 4 General

# 4.1 Relationship between minimum requirements and test requirements

The present document is interwork specification for NR UE, covering RF characteristics and minimum performance requirements. Conformance to the present specification is demonstrated by fulfilling the test requirements specified in the conformance specification 3GPP TS 38.521-3 [5].

The Minimum Requirements given in this specification make no allowance for measurement uncertainty. The test specification TS 38.521-3 [5] defines test tolerances. These test tolerances are individually calculated for each test. The test tolerances are used to relax the minimum requirements in this specification to create test requirements. For some requirements, including regulatory requirements, the test tolerance is set to zero.

The measurement results returned by the test system are compared - without any modification - against the test requirements as defined by the shared risk principle.

The shared risk principle is defined in Recommendation ITU-R M.1545 [6].

# 4.2 Applicability of minimum requirements

- a) In this specification the Minimum Requirements are specified as general requirements and additional requirements. Where the Requirement is specified as a general requirement, the requirement is mandated to be met in all scenarios
- b) For specific scenarios for which an additional requirement is specified, in addition to meeting the general requirement, the UE is mandated to meet the additional requirements.
- c) The spurious emissions power requirements are for the long-term average of the power. For the purpose of reducing measurement uncertainty it is acceptable to average the measured power over a period of time sufficient to reduce the uncertainty due to the statistical nature of the signal
- d) Terminal that supports EN-DC configuration shall meet E-UTRA requirements as specified in TS 36.101 [4] and NR requirements as in TS 38.101-1 [2] and TS 38.101-2 [3] unless otherwise specified in this specification
- e) All the requirements for intra-band contiguous and non-contiguous EN-DC apply under the assumption of the same uplink-downlink and special subframe configurations in the E-UTRA and slot format indicated by UL-DL-configurationCommon and UL-DL-configurationDedicated in the NR for the EN-DC.
- f) For EN-DC combinations with CA configurations for E-UTRA and/or NR, all the requirements for E-UTRA and/or NR all the requirements for E-UTRA and/or NR intra-band contiguous and non-contiguous CA apply under the assumption of the same slot format indicated by UL-DL-configurationCommon and UL-DL-configurationDedicated in the PSCell and SCells for NR and the same uplink-downlink and special subframe configurations in Pcell and SCells for E-UTRA.

A terminal which supports an EN-DC configuration shall support:

If any subsets of the EN-DC configuration do not specify its own bandwidth combination sets in 5.3B, then the terminal shall support the same E-UTRA bandwidth combination sets it signals the support for in E-UTRA CA configuration part of E-UTRA – NR DC and shall support the same NR bandwidth combination sets it signals the support for in NR CA configuration part of E-UTRA – NR DC.

Else if one of the subsets of the EN-DC configuration specify its own bandwidth combination sets in 5.3B, then the terminal shall support a product set of channel bandwidth for each band specified by E-UTRA bandwidth combination sets, NR bandwidth combination sets, and EN-DC bandwidth combination sets it singnals the support. A terminal which supports an inter-band EN-DC configuration with a certain UL configuration shall support the all lower order DL configurations of the lower order EN-DC combinations, which have this certain UL configuration and the fallbacks of this UL configuration.

A terminal which supports CA or DC configurations, which include FR2 intra-band CA combinations with multiple subblocks, where at least one of the subblocks consists of a contiguous CA combination, is not required to support all possible fallback combinations but can directly fall back to a single FR2 carrier. Deactivating carriers within the CA or DC combination is still possible.

Terminal that supports inter-band NR-DC between FR1 and FR2 configuration shall meet the requirements for corresponding CA configuration (suffix A), unless otherwise specified.

# 5 Operating bands and channel arrangement

#### 5.1 General

The channel arrangements presented in this clause are based on the operating bands and channel bandwidths defined in the present release of specifications.

NOTE: Other operating bands and channel bandwidths may be considered in future releases.

Requirements throughout the RF specifications are in many cases defined separately for different frequency ranges (FR). The frequency ranges in which NR can operate according to this version of the specifications are identified as described in Table 5.1-1.

Table 5.1-1: Definition of frequency ranges

Frequency range designation	Corresponding frequency range
FR1	410 MHz – 7125 MHz
FR2	24250 MHz – 52600 MHz

The present specification covers band combinations including

- at least one FR1 operating band and one FR2 operating band for carrier aggregation and dual connectivity operations;
- at least one E-UTRA operating band for dual connectivity operations.

# 5.2 Operating bands

NR is designed to operate in FR1 operating bands defined in TS 38.101-1 [2] and FR2 operating bands defined in TS 38.101-2 [3]. E-UTRA is designed to operate in operating bands defined in TS 36.101 [4].

### 5.2A.1 Inter-band CA between FR1 and FR2

NR carrier aggregation is designed to operate in the operating bands defined in Table 5.2A.1-1 and Table 5.2A.1-2. The band combinations include at least one FR1 operating band and one FR2 operating band.

Operating bands for CA including Band n90 are defined by the corresponding operating bands for CA including Band n41 with Band n90 replacing Band n41. For brevity the said operating bands for CA including Band n90 are not listed in the tables below but are covered by this specification.

# 5.3 UE Channel bandwidth

#### 5.3A UE Channel bandwidth for CA

#### 5.3A.1 Inter-band CA between FR1 and FR2

NOTE 1: Only single switched SL in ITS band is supported.

For inter-band NR CA between FR1 and FR2, a carrier aggregation configuration is a combination of operating bands, each supporting a carrier aggregation bandwidth class as specified in clause 5.3A.5 of TS 38.101-1 [2] and clause 5.3A.4 of TS 38.101-2 [3] independently.

## 5.3B UE Channel bandwidth for EN-DC

For intra-band contiguous EN-DC, the aggregated channel bandwidth is sum of the individual NR and E-UTRA channel bandwidths assuming nominal EN-DC channel with 0 kHz offset spacing as specified in clause 5.4.

$$ENBW = BW_{NR\ Channel} + BW_{E\text{-}UTRA\ Channel}$$

In the case where the NR sub-block and/or the E-UTRA sub-block itself is composed of intra-band contiguous CA carriers, the EN-DC aggregated channel bandwidth is the sum of the aggregated channel bandwidths of the NR and E-UTRA sub-blocks assuming nominal EN-DC channel spacing between the NR sub-block and E-UTRA sub-block.

$$ENBW = BW_{NR\_Channel\_CA} + BW_{E\text{-}UTRA\_Channel\_CA}$$

For NR inter-band dual connectivity specified in 5.5B.7, the corresponding NR CA configurations in 5.5A.1, i.e., dual uplink inter-band carrier aggregation between FR1 and FR2 with uplink assigned to two NR bands, are applicable to Dual Connectivity.

NOTE 1: Requirements for the dual connectivity configurations are defined in the clause corresponding NR uplink CA between FR1 and FR2 configurations, unless otherwise specified.

Intra-band contiguous EN-DC configurations are defined using intra-band contiguous EN-DC bandwidth class notation DC\_(n)Xyz where the first EN-DC bandwidth class letter y indicates the number of contiguous E-UTRA carriers and the second EN-DC bandwidth class letter z indicates the number of contiguous NR carriers for the EN-DC combination of E-UTRA Band X and NR Band nX. Applicable contiguous intraband EN-DC bandwidth classes are listed in Table 5.3.B-1.

Table 5.3.B-1: Intra-band contiguous EN-DC bandwidth classes

Intra-band contiguous EN-DC bandwidth class	Number of contiguous CC						
Dandwidth Class	E-UTRA	NR					
AA	1	1					
CA	2	1					
DA	3	1					

The UE channel bandwidths for band combinations including Band n41 also apply for the corresponding band combinations with Band n90 replacing Band n41 but with otherwise identical parameters. For brevity the said UE channel bandwidths for band combinations with Band n90 are not listed in the tables below but are covered by this specification.

#### 5.3B.1 Intra-band EN-DC in FR1

#### 5.3B.1.1 General

The requirements for intra-band EN-DC in this specification are defined for EN-DC configurations with associated bandwidth combination sets.

For each EN-DC configuration, requirements are specified for all bandwidth combinations contained in a *bandwidth combination set*, which is indicated per supported band combination in the UE radio access capability. A UE can indicate support of several bandwidth combination sets per band combination.

#### 5.3B.1.2 BCS for Intra-band contiguous EN-DC

For intra-band contiguous EN-DC, an EN-DC configuration is a single operating band supporting an intra-band contiguous EN-DC bandwidth class.

Bandwidth combination sets for intra-band contiguous EN-DC are specified in Table 5.3B.1.2-1.

Table 5.3B.1.2-1: EN-DC configurations and bandwidth combination sets defined for intra-band contiguous EN-DC

NOTE 3: For maximum DL aggregated bandwidth of 25 MHz the asymmetric UL and DL channel bandwidth combination

of Table 5.3.6-1 in TS 38.101-1 [2] is used with a maximum UL contiguous aggregated bandwidth of 20 MHz. Furthermore, a restriction is imposed on bandwidth combinations so that only a subset of BCS1 is allowed to be used on the uplink, and this subset is equivalent to BCS0.

NOTE4: Only single switched UL is supported.

NOTE5: The minimum requirements only apply for non-simultaneous Tx/Rx between all carriers.

#### 5.3B.1.3 BCS for Intra-band non-contiguous EN-DC

For intra-band non-contiguous EN-DC, an EN-DC configuration is a single operating band supporting E-UTRA and NR carriers, where E-UTRA configuration is indicated by using E-UTRA CA bandwidth class as defined in TS 36.101 [4] and NR configuration is indicated by using NR CA bandwidth class as defined in TS 38.101-1 [2].

Requirements for intra-band non-contiguous EN-DC are defined for the EN-DC configurations and bandwidth combination sets specified in Table 5.3B.1.3-1.

#### 5.3E UE Channel bandwidth for V2X

The requirements specified in clause 5.3B are applicable to NR V2X UE.

# 5.3E.1 Intra-band contiguous V2X in FR1

For intra-band contiguous E-UTRA NR V2X UE, an EN-DC bandwidth class in Table 5.3.B-1 are considered to specify the V2X transmission/reception configurations.

Bandwidth combination sets and V2X transmission/reception configurations for intra-band contiguous V2X UE are specified in Table 5.3E.1-1.

Table 5.3E.1-1: E-UTRA-NR V2X configurations and bandwidth combination sets for intra-band contiguous V2X UE

V2X configuration	band   carrier   carrier   (MHz)   (MHz)		Maximum aggregated bandwidth (MHz)	Bandwidth combination set		
VOV (a) 47A A		10	10,20,30,40	60	0	
V2X_(n)47AA	n47 or NR band	20	10,20,30,40	60	0	

# 5.3E.2 Intra-band non-contiguous V2X in FR1

For intra-band non-contiguous E-UTRA NR V2X UE, an EN-DC bandwidth class in Table 5.3.B-1 are considered to specify the V2X transmission/reception configurations.

Bandwidth combination sets and SL transmission/reception configurations for intra-band non-contiguous V2X are specified in Table 5.3E.2-1.

Table 5.3E.2-1: E-UTRA-NR V2X configurations and bandwidth combination sets for intra-band noncontiguous V2X UE

V2X configuration	band   carric (MHz		Channel bandwidths for NR carrier (MHz)	Maximum aggregated bandwidth (MHz)	Bandwidth combination set	
\/2\\ 47\\ ~47\		10	10,20,30,40	60	0	
V2X_47A_n47A	n47 or NR band	20		60	0	

#### 5.3E.3 Inter-band V2X in FR1

For inter-band E-UTRA NR V2X UE, the each channel bandwidth for inter-band V2X operations in FR1 is specified in TS 36.101 [4] and TS 38.101-1 [2], respectively.

#### 5.4 Void

# 5.4A Channel arrangement for CA

The channel arrangement for CA operations in FR1 and FR2 as specified in TS 38.101-1 [2] and TS 38.101-2 [3], respectively.

# 5.4B Channel arrangement for DC

The channel arrangement for intra-band EN-DC operations in FR1 is specified in TS 36.101 [4] and TS 38.101-1 [2] , respectively.

# 5.4B.1 Channel spacing for intra-band EN-DC carriers

The spacing between carriers will depend on the deployment scenario, the size of the frequency block available and the channel bandwidths. The nominal channel spacing between and E-UTRA carrier and an adjacent NR carrier for intraband contiguous EN-DC is defined as following:

- For NR operating bands with 100 kHz channel raster,

Nominal Channel spacing = 
$$(BW_{E-UTRA\_Channel} + BW_{NR\_Channel})/2$$

- For NR operating bands with 15 kHz channel raster,
  - Nominal Channel spacing =  $(BW_{E-UTRA\_Channel} + BW_{NR\_Channel})/2 + \{-5kHz, 0kHz, 5kHz\}$  for  $\Delta F_{Raster}$  equals to 15 kHz
  - Nominal Channel spacing =  $(BW_{E-UTRA\_Channel} + BW_{NR\_Channel})/2 + \{-10 \text{ kHz}, 0 \text{ kHz}, 10 \text{ kHz}\}$  for  $\Delta F_{Raster}$  equals to 30 kHz

where  $BW_{E\text{-}UTRA\_Channel}$  and  $BW_{NR\_Channel}$  are the channel bandwidths of the E-UTRA and NR carriers,  $\Delta F_{Raster}$  is the band dependent channel raster granularity defined in TS38.101-1[2]. The channel spacing can be adjusted depending on the channel raster to optimize performance in a particular deployment scenario.

For intra-band non-contiguous EN-DC the channel spacing between E-UTRA and NR carriers shall be larger than the nominal channel spacing defined in this clause

# 5.5 Configuration

# 5.5A Configuration for CA

# 5.5A.1 Inter-band CA configurations between FR1 and FR2

The configurations for operating bands for CA including Band n41 also apply for the corresponding operating bands for CA with Band n90 replacing Band n41 but with otherwise identical parameters. For brevity the said configuration for operating bands for CA with Band n90 are not listed in the tables below but are covered by this specification.

## 5.5B Configuration for DC

## 5.5B.1 General

The operating bands and bandwidth classes are specified for operation with EN-DC, NGEN-DC, NE-DC or NR-DC configured. The EN-DC, NGEN-DC or NE-DC band combinations include at least one E-UTRA operating band.

For EN-DC or NE-DC configurations indicated by column "Single Uplink allowed" (e.g., problematic band combinations as defined in TS 38.306 [11]) in tables in this clause the UE may indicate capability of not supporting simultaneous dual and triple uplink operation due to possible intermodulation interference to its own primary downlink channel bandwidth of PCell or PSCell if the intermodulation order is 2 or if the intermodulation order is 3 for the combinations when both operating bands are between 450~MHz - 960~MHz or between 1427~MHz - 2690~MHz. When LTE and NR transmissions collide, simultaneous dual transmissions may not be supported by UE for these EN-DC band combinations for which only single switched UL is supported.

In the case for EN-DC or NE-DC configurations listed in tables in this clause for which the intermodulation products caused by the dual and triple uplink operation fall into the receive band but do not interfere with its own primary downlink channel bandwidth of PCell or PSCell as defined in Annex I the UE is mandated to operate in dual and triple uplink mode. Single Uplink is also allowed for certain band combinations where intermodulation or reverse intermodulation products could create difficulty for meeting emission requirementsFor EN-DC combinations of order 3 or higher, "Single Uplink allowed" UL configurations captured in Table 5.5B.2-1, Table 5.5B.3-1, and Table 5.5B.4-1 apply.

If multiple UL DC configurations are listed for multiple DL DC configurations, valid uplink configurations are such that uplink does not have more carriers than downlink.

The configurations for operating bands for DC including Band n41 also apply for the corresponding operating bands for DC with Band n90 replacing Band n41 but with otherwise identical parameters. For brevity the said configuration for operating bands for DC with Band n90 are not listed in the tables below but are covered by this specification.

Non contiguous resource allocation and almost contiguous allocation are not applicable for E UTRA or NR carrier part of intra band EN DC configuration.

NOTE 5: The minimum requirements only apply for non-simultaneous Tx/Rx between all carriers.

NOTE 6: Only single switched UL is supported

NOTE 2: Only single switched UL is supported in Rel.15

NOTE 3: The minimum requirements only apply for non-simultaneous Tx/Rx between all carriers.

NOTE 4: Single UL allowed due to potential emission issues, not self-interference.

NOTE 5: Only single switched UL is supported.

NOTE 6: Requirements in this specification apply for NR SCS of 15 kHz only.

configuration	configuration	Single UL allowed
-	(NOTE 1)	

- NOTE 1: Uplink EN-DC configurations are the configurations supported by the present release of specifications.
- NOTE 2: Restricted to E-UTRA operation when inter-band carrier aggregation is configured. The downlink operating band for Band 46 is paired with the uplink operating band (external E-UTRA band) of the carrier aggregation configuration that is supporting the configured Pcell.
- NOTE 3: The minimum requirements apply only when there is non-simultaneous Tx/Rx operation between E-UTRA and NR carriers. This restriction applies also for these carriers when applicable EN-DC configuration is part of a higher order EN-DC configuration.
- NOTE 4: The minimum requirements for intra-band contiguous or non-contiguous EN-DC apply. The intra-band requirements also apply for these carriers when applicable EN-DC configuration is a subset of a higher order EN-DC configuration.
- NOTE 5: The frequency range above 3600 MHz for Band n78 is not used in this combination.
- NOTE 6: The frequency range below 2506 MHz for Band 41 is not used in this combination.
- NOTE 7: Applicable for UE supporting inter-band EN-DC with mandatory simultaneous Rx/Tx capability.
- NOTE 8: The frequency range in band n28 is restricted for this band combination to 703 733 MHz for the UL and 758-788 MHz for the DL.
- NOTE 9: The combination is not used alone as fall back mode of other band combinations in which UL in Band 42 is not used.
- NOTE 10: The maximum power spectral density imbalance between downlink carriers is within 6 dB. The power spectral density imbalance condition also applies for these carriers when applicable EN-DC configuration is a subset of a higher order EN-DC configuration.
- NOTE 11: The minimum requirements for inter-band EN-DC apply when the maximum power spectral density imbalance between downlink carriers is within 6 dB. The power spectral density imbalance condition also applies for these carriers when applicable EN-DC configuration is a subset of a higher order EN-DC configuration.
- NOTE 12: Applicable for frequency range above 4800 MHz for Band n79 in this combination.
- NOTE 13: The minimum requirements apply for synchronized DL carriers with a maximum receive time difference ≤ 3 usec. The requirements also apply for these carriers when applicable EN-DC configuration is a subset of a higher order EN-DC configuration.

- NOTE 1: Uplink EN-DC configurations are the configurations supported by the present release of specifications.
- NOTE 2: Only single switched UL is supported
- NOTE 3: Restricted to E-UTRA operation when inter-band carrier aggregation is configured. The downlink operating band for Band 46 is paired with the uplink operating band (external E-UTRA band) of the carrier aggregation configuration that is supporting the configured Pcell.
- NOTE 4: If a UE is configured with both NR UL and NR SUL carriers in a cell, the switching time between NR UL carrier and NR SUL carrier can be up to 140us and placed in SUL resources.
- NOTE 5: Applicable for UE supporting inter-band EN-DC with mandatory simultaneous Rx/Tx capability
- NOTE 6: The frequency range in band n28 is restricted for this band combination to 703-733 MHz for the UL and 758 788 MHz for the DL.
- NOTE 7: Void.
- NOTE 8: UL carrier shall be supported in Band 2 only. Power imbalance between downlink carriers on Band 7 and Band 38 is assumed to be within 6dB.
- NOTE 9: UL carrier shall be supported in Band 66 only. Power imbalance between downlink carriers on Band 7 and Band 38 is assumed to be within 6dB.

NOTE 1: Uplink EN-DC configurations are the configurations supported by the present release of specifications.

NOTE 2: Applicable for UE supporting inter-band EN-DC with mandatory simultaneous Rx/Tx capability

NOTE 3: The frequency range in band n28 is restricted for this band combination to 703-733 MHz for the UL and 758-788 MHz for the DL.

NOTE 4: Only single switched UL is supported.

NOTE 5: UL carrier shall be supported in Band 2 or band 66 only. Power imbalance between downlink carriers on Band 7 and Band 38 is assumed to be within 6dB.

### 6 Transmitter characteristics

### 6.1 General

Unless otherwise stated the transmitter characteristics are specified at the antenna connector(s) of the UE for the bands operating on frequency range 1 and over the air of the UE for the bands operating on frequency range 2. The requirements for frequency range 1 and frequency range 2 can be verified separately. For the carrier in frequency range 1, requirements can be verified with NR FR2 link disabled. For the carrier in frequency range 2, requirements can be verified in OTA mode with E-UTRA connecting to the network by OTA without calibration.

Unless otherwise stated, requirements for NR transmitter written in TS 38.101-1 [2] and TS 38.101-2 [3] apply and are assumed anchor agnostic. Requirements are verified under conditions where anchor resources do not interfere NR operation. If UE indicates IE [powerClassNRPart] as defined in TS 38.331 [9] in EN-DC, UE shall meet NR requirements according to this power class.

For sub-clauses with suffix A or B: the minimum requirements for band combinations including Band n41 also apply for the corresponding band combinations with Band n90 replacing Band n41 but with otherwise identical parameters. For brevity the said band combinations with Band n90 are not listed in the tables below but are covered by this specification.

## 6.2A.2 UE maximum output power reduction for CA

For inter-band NR CA between FR1 and FR2, UE maximum output power reduction specified in TS 38.101-1 [2] and TS 38.101-2 [3] apply for each frequency range respectively.

### 6.2A.3 UE additional maximum output power reduction for CA

#### 6.2B.1.3 Inter-band EN-DC within FR1

For inter-band EN-DC of E-UTRA and NR in FR1, the following UE Power Classes define the maximum output power for any transmission bandwidth within the aggregated channel bandwidth. The maximum output power is measured as the sum of the maximum output power at each UE antenna connector. The period of measurement shall be at least one sub frame (1ms). UE maximum output power shall be measured over all component carriers from different bands. If each band has separate antenna connectors, maximum output power is measured as the sum of maximum output power at each UE antenna connector.

## 6.2B.1.3a Inter-band NE-DC within FR1

For inter-band NE-DC of E-UTRA and NR in FR1, the following UE power classes define the maximum output power for any transmission bandwidth within the aggregated channel bandwidth. The maximum output power is measured as the sum of the maximum output power at each UE antenna connector. The period of measurement shall be at least one sub frame (1 ms). UE maximum output power shall be measured over all component carriers from different bands. If each band has separate antenna connectors, maximum output power is measured as the sum of maximum output power at each UE antenna connector.

## 6.2B.3.1.2 A-MPR for NS\_04

#### 6.2B.3.1.2.0 General

When the UE is configured for B41/n41 intra-band contiguous EN-DC and it receives IE NS\_04, the UE determines the total allowed maximum output power reduction as specified in this clause. The A-MPR for EN-DC defined in this clause is used instead of MPR defined in 6.2B.2.1, not additively, so EN-DC MPR = 0 when NS\_04 is signaled. For UEs scheduled with single uplink transmission, AMPR in clause 6.2.4 of [4] and 6.2.3 of [2] apply.

For UE supporting dynamic power sharing the following:

- for the MCG, A-MPR<sub>c</sub> in accordance with TS 36.101 [4]
- for the SCG,

$$A-MPR'_{c} = A-MPR_{NR} = MAX(A-MPR_{single,NR}, A-MPR_{IM3})$$

- for the total configured transmission power,

$$\begin{aligned} A-MPR_{tot} &= P_{PowerClass,EN-DC} - min(P_{PowerClass,EN-DC}, 10*log_{10}(10^{\land}((P_{PowerClass,E-UTRA} - A-MPR_{E-UTRA})/10) + 10^{\land}((P_{PowerClass,NR} - A-MPR_{NR})/10)) \end{aligned}$$

where

$$A-MPR_{E-UTRA} = MAX(A-MPR_{single,E-UTRA} + MPR_{single,E-UTRA}, A-MPR_{IM3})$$

with

- A-MPR<sub>single, E-UTRA</sub> is the A-MPR defined for the E-UTRA transmission in TS 36.101 [4]
- A-MPR<sub>single,NR</sub> is the A-MPR defined for the NR transmission in TS 38.101-1 [2]
- MPR<sub>single,E-UTRA</sub> is the MPR defined for the E-UTRA transmission in TS 36.101 [4]

For UEs not supporting dynamic power sharing the following

for the MCG,

$$A-MPR_{c} = MAX(A-MPR_{single, E-UTRA} + MPR_{single, E-UTRA}, A-MPR_{IM3})$$

- for the SCG,

$$A-MPR'_c = MAX(A-MPR_{single,NR}, A-MPR_{IM3})$$

where

- $A\text{-MPR}_{\text{single, E-UTRA}}$  is the A-MPR defined for the E-UTRA transmission in TS 36.101 [4]
- A-MPR<sub>single,NR</sub> is the A-MPR defined for the NR transmission in TS 38.101-1 [2]
- MPR<sub>single,E-UTRA</sub> is the MPR defined for the E-UTRA transmission in TS 36.101 [4]

The UE determines the Allocation Configuration Case and the value of A-MPR<sub>IM3</sub> as follows:

If  $F_{IM3,low\_block,low}$  < 2490.5 MHz

Allocation Configuration Case B. A-MPR<sub>IM3</sub> defined in Clause 6.2B.3.1.2.2

Else

Allocation Configuration Case A. A-MPR<sub>IM3</sub> defined in Clause 6.2B.3.1.2.1

where

- $F_{IM3,low\ block,low} = (2 * F_{low\ alloc,low\ edge}) F_{high\ alloc,high\ edge}$
- F<sub>low alloc,low edge</sub> is the lowermost frequency of lower transmission bandwidth configuration.
- Fhigh allochigh edge is the uppermost frequency of upper transmission bandwidth configuration.

Where the transmission bandwidth configuration for NR is the maximum frequency span covering all the configured SCSSpecificCarrier for scenarios that carrier bandwidths with different SCS can be fully overlapped.

NOTE: For non-dynamic power sharing capable UEs, since the allocation is unknown for one RAT, the edges of the channel transmission bandwidth are used instead of the edges of the RB allocations for that RAT.

#### 6.2B.3.1.2.1 A-MPR<sub>IM3</sub> for NS 04 to meet -13 dBm / 1MHz

A-MPR in this clause is relative to 26 dBm for a power class 2 Cell Group. The same A-MPR is used relative to 23 dBm for a power class 3 Cell Group. For the UE is configured with allocation configurations Case A or Case C (defined in Clause 6.2B.3.2.1), the allowed maximum output power reduction for IM3s applied to transmission on the MCG and the SCG with non-contiguous resource allocation is defined as follows:

$$A-MPR_{IM3} = M_A$$

Where MA is defined as follows

Where:

For UEs supporting dynamic power sharing,

$$B = (L_{CRB\_alloc, E-UTRA} * 12* SCS_{E-UTRA} + L_{CRB\_alloc, NR} * 12* SCS_{NR})/1,000,000$$

For UEs not supporting dynamic power sharing,

For E-UTRA

$$B = (L_{CRB\_alloc, E-UTRA} * 12* SCS_{E-UTRA} + 12* SCS_{NR})/1,000,000$$

Where  $SCS_{NR} = 15$  kHz is assumed in calculation of B.

For NR

$$B = (12*SCS_{E\text{-}UTRA} + L_{CRB\_alloc,NR}*12*SCS_{NR})/1,000,000$$

Where  $SCS_{E-UTRA} = 15$  kHz is assumed in calculation of B.

and  $M_A$  is reduced by 1 dB for B < 2.0.

#### 6.2B.3.1.2.2 A-MPR for NS\_04 to meet -25 dBm / 1MHz for 26 dBm UE power

## 6.2B.3.2 Intra-band non-contiguous EN-DC

## 6.2B.3.2.0 General

For intra-band non-contiguous EN-DC band combinations with additional requirements the A-MPR allowed are specified in Table 6.2B.3.2.0-1 for UEs configured with EN-DC and combinations of network signalling values indicated in the E-UTRA and NR cell group(s). Unless otherwise stated the A-MPR specified in clause 6.2B.3.2 for intra-band non-contiguous EN-DC configurations is the total power reduction allowed including MPR. For UEs scheduled with single uplink transmission, AMPR in clause 6.2.4 of [4] and 6.2.3 of [2] apply.

Table 6.2B.3.2.0-1: Allowed power reduction for intra-band non-contiguous EN-DC

DC configuration	Requirement (clause)	E-UTRA network signalling value	NR network signalling value	A-MPR (clause)
DC_41A_n41A <sup>1</sup>	6.6.3.3.19 and 6.6.2.2.2 of TS 36.101 [4] and 6.5.2.3.2 and 6.5.3.3.1 of TS 38.101-1 [2]	NS_01 or NS_04	NS_04	6.2B.3.2.1

### 6.2B.3.2.1 A-MPR for NS\_04

When the UE is configured for B41/n41 intra-band non-contiguous EN-DC and it receives IE NS\_04, the UE determines the total allowed maximum output power reduction as specified in this clause. The A-MPR for EN-DC

defined in this clause is used instead of MPR defined in 6.2B.2.2, not additively, so EN-DC MPR=0 when NS\_04 is signaled.

For UE supporting dynamic power sharing the following:

- for the MCG, A-MPR<sub>c</sub> in accordance with TS 36.101 [4]
- for the SCG.

$$A-MPR'_c = A-MPR_{NR} = MAX(A-MPR_{single,NR}, A-MPR_{EN-DC})$$

- for the total configured transmission power,

$$\begin{aligned} A\text{-MPR}_{tot} = P_{PowerClass,EN\text{-DC}} - min(P_{PowerClass,EN\text{-DC}}, 10*log_{10}(10^{\land}((P_{PowerClass,E\text{-UTRA}}\text{- A-MPR}_{E\text{-UTRA}})/10) + \\ 10^{\land}((P_{PowerClass,NR}\text{- A-MPR}_{NR})/10)) \end{aligned}$$

where

$$\begin{split} A\text{-MPR}_{E\text{-UTRA}} &= MAX(\ A\text{-MPR}_{single,E\text{-UTRA}} + MPR_{single,E\text{-UTRA}},\ A\text{-MPR}_{EN\text{-DC}}) \\ &A\text{-MPR}_{EN\text{-DC}} &= MAX(A\text{-MPR}_{IM3},\ A\text{-MPR}_{ACLRoverlap}) \end{split}$$

with

- A-MPR<sub>single, E-UTRA</sub> is the A-MPR defined for the E-UTRA transmission in TS 36.101 [4]
- A-MPR<sub>single,NR</sub> is the A-MPR defined for the NR transmission in TS 38.101-1 [2]
- MPR<sub>single,E-UTRA</sub> is the MPR defined for the E-UTRA transmission in TS 36.101 [4]

For UEs not supporting dynamic power sharing the following

for the MCG,

$$A-MPR_c = MAX(A-MPR_{single, E-UTRA} + MPR_{single, E-UTRA}, A-MPR_{IM3}, A-MPR_{ACLRoverlap})$$

for the SCG,

where

- A-MPR<sub>single, E-UTRA</sub> is the A-MPR defined for the E-UTRA transmission in TS 36.101 [4]
- A-MPR<sub>single,NR</sub> is the A-MPR defined for the NR transmission in TS 38.101-1 [2]
- MPR<sub>single,E-UTRA</sub> is the MPR defined for the E-UTRA transmission in TS 36.101 [4]

The UE determines the Allocation Configuration Case and the value of A-MPR<sub>IM3</sub> as follows:

$$If \ AND(\ F_{IM3,low\_block,high} < F_{filter,low},\ MAX(\ SEM_{-13,high},\ F_{IM3,high\_block,low}\ ) > F_{filter,high}\ )$$

Allocation Configuration Case C. A-MPR<sub>IM3</sub> defined in Clause 6.2B.3.1.2.1

Else

Allocation Configuration Case D. A-MPR<sub>IM3</sub> defined in Clause 6.2B.3.1.2.2

where

- $F_{IM3,low\_block,high} = (2 * F_{low\_alloc,high\_edge}) F_{high\_alloc,low\_edge}$
- $F_{IM3,high\_block,low} = (2 * F_{high\_alloc,low\_edge}) F_{low\_alloc,high\_edge}$
- F<sub>low\_alloc,low\_edge</sub> is the lowermost frequency of lower transmission bandwidth allocation.
- Flow alloc,high edge is the uppermost frequency of lower transmission bandwidth allocation.

- F<sub>high\_alloc,low\_edge</sub> is the lowermost frequency of upper transmission bandwidth allocation.
- F<sub>high alloc,high edge</sub> is the uppermost frequency of upper transmission bandwidth allocation.
- $F_{\text{filter,low}} = 2480 \text{ MHz}$
- $F_{\text{filter,high}} = 2745 \text{ MHz}$
- SEM<sub>-13,high</sub> = Threshold frequency where upper spectral emission mask for upper channel drops from -13 dBm / 1MHz to -25 dBm / 1MHz, as specified in Clause 6.6.2.2.2 in [4] and Clause 6.5.2.3.2 in [2] respectively.

Where the transmission bandwidth configuration for NR is the maximum frequency span covering all the configured SCSSpecificCarrier for scenarios that carrier bandwidths with different SCS can be fully overlapped

Table 6.2B.3.2.1-1: A-MPR<sub>ACLRoverlap</sub>

W <sub>gap</sub>	A-MPR <sub>ACLRoverlap</sub>
< BW <sub>channel,E-UTRA</sub> + BW <sub>channel,NR</sub>	4 dB
≥ BWchannel,E-UTRA + BWchannel,NR	0 dB
NOTE 1: Wgap = Fhigh_channel,low_edge - Flow_chan	nel,high_edge

#### 6.2B.3.3 Inter-band EN-DC within FR1

If the UE does not support dynamic power sharing,

$$P_{Total}^{EN-DC} = MIN \{ P_{EMAX, EN-DC}, P_{PowerClass, EN-DC} - \Delta P_{PowerClass, EN-DC} \} + 0.3 dB$$

For UEs indicating support of dynamicPowerSharing in the UE-MRDC-Capability IE the UE can configure the total maximum transmission power  $P_{Total}^{EN-DC}$  within the range

$$P_{\text{EN-DC,tot L}} \leq P_{Total}^{EN-DC} \leq P_{\text{EN-DC,tot H}}$$

$$P_{\text{EN-DC,tot\_L}}(\textit{p},\textit{q}) = MIN\{\ P_{\text{PowerClass,EN-DC}} - \Delta P_{\text{PowerClass,EN-DC}} - MAX\{MPR_{\text{tot}},\ A\text{-MPR}_{\text{tot}}\},\ P_{\text{EMAX,EN-DC}}\}$$

$$P_{\text{EN-DC,tot\_H}}(p,q) = \text{MIN}\{P_{\text{PowerClass,EN-DC}}, P_{\text{EMAX,EN-DC}}\}$$

where  $p_{UMAX,c,E-UTRA}$  and  $p_{UMAX,c,NR}$  denotes the measured output power of serving cell c for E-UTRA and NR respectively, expressed in linear scale.

For UEs indicating support of dynamicPowerSharing, the measured total configured maximum output power  $P_{UMAX}$  shall be within the following bounds:

When an UL subframe transmission p from E-UTRA overlap with a physical channel q from the NR, then for  $P_{\text{UMAX}}$  evaluation, the E-UTRA subframe p is taken as reference period  $T_{\text{REF}}$  and always considered as the reference measurement duration and the following rules are applicable.

 $10log(p_{CMAX\ L,f,c,NR}(q)/X\_scale) - T_{LOW}\left(10log(p_{CMAX\ L,f,c,NR}(q)/X\_scale)\right)\} \leq P_{UMAX,f,c,NR}(q) \leq 10log(p_{CMAX\ H,\ f,c,NR}(q)) + T_{HIGH}\left(10log(p_{CMAX\ H,\ f,c,NR}(q))\right).$

For inter-band dual connectivity with one uplink serving cell or more than one uplink serving cells configured for intraband UL CA on the E-UTRA CG and one uplink serving cell on the NR CG or more than one uplink serving cells configured for intra-band UL CA, the UE is allowed to set its configured maximum output power  $P_{CMAX,c(i),i}$  for serving cell c(i) of CG i, i=1,2, and its total configured maximum transmission power for EN-DC operation,  $P_{Total}^{EN-DC} = 10\log 10(\hat{P}_{total}^{EN-DC})$  with  $\hat{P}_{total}^{EN-DC}$  as specified in clause 7.6 of TS 38.213 [10]. For EN-DC with more than one uplink serving cells configured for intra-band UL CA on the E-UTRA CG, the  $P_{CMAX}$  applies to the entire E-UTRA CG. For EN-DC with more than one uplink serving cells configured for intra-band UL CA on the NR CG, the  $P_{CMAX}$  applies to the entire NR CG.

For a UE configured with EN-DC and serving cell frame structure type 1, if the UE is configured with *subframeAssignment-r15* for the serving cell and E-UTRA Pcell is FDD, the UE is not expected to be configured with more than one serving cells in the uplink.

The configured maximum output power  $P_{CMAX\_E-UTRA,c}(p)$  in sub-frame p for the configured E-UTRA uplink carrier(s) shall be set within the bounds:

$$P_{\text{CMAX\_L\_E-UTRA},c}(p) \le P_{\text{CMAX\_E-UTRA},c}(p) \le P_{\text{CMAX H\_E-UTRA},c}(p)$$

where  $P_{CMAX\_L\_E-UTRA,c}$  and  $P_{CMAX\ H\_E-UTRA,c}$  are the limits for a serving cell c as specified in TS 36.101 [4] clause 6.2.5 modified by  $P_{LTE}$  as follows:

```
\begin{split} P_{CMAX\_L\_E-UTRA,c} &= MIN \; \{ \; P_{EMAX,\;EN-DC} \; , \; (P_{PowerClass,\;EN-DC} - \Delta P_{PowerClass,EN-DC} \; ), \; MIN(P_{EMAX,c} \; , \; P_{LTE}) - \Delta t_{C\_E-UTRA,\;c} \; , \\ & \; (P_{PowerClass,E-UTRA} - \Delta P_{PowerClass,E-UTRA}) - MAX(MPR_c + A-MPR_c + \Delta T_{IB,c} \; + \Delta t_{C\_E-UTRA,\;c} + \Delta T_{ProSe} \; , P-MPR_c) \} \end{split}
```

 $P_{CMAX\;H\_E-UTRA,c} = MIN\; \{P_{EMAX,c},\;\; P_{EMAX,\;EN-DC}\;\;,\; (P_{PowerClass,\;EN-DC} - \Delta P_{PowerClass,EN-DC}\;),\; P_{LTE},\; P_{PowerClass,E-UTRA} - \Delta P_{PowerClass,E-UTRA}\}$ 

For EN-DC with more than one uplink serving cells configured for intra-band UL CA on the E-UTRA CG,  $P_{CMAX\_L\_E-UTRA,c}$  and  $P_{CMAX\_H\_E-UTRA,c}$  are the limits for the E-UTRA CG as specified in TS 36.101 [4] clause 6.2.5A modified by  $P_{LTE}$  as follows:

$$\begin{split} P_{CMAX\_L\_E-UTRA,c} &= MIN\{10 \ log_{10} \sum p_{EMAX,c} \ - \Delta T_C \ , \ (P_{PowerClass} - \Delta P_{PowerClass}) - MAX(MPR + A-MPR + \Delta T_{IB,c} + \Delta T_C + \Delta T_{ProSe}, P-MPR) \ , P_{LTE}, P_{powerclass,ENDC} \} \end{split}$$

$$P_{CMAX\ H\_E-UTRA,c} = MIN\{10\ log_{10} \sum p_{EMAX,c}, P_{PowerClass}, P_{LTE}, P_{powerclass,ENDC}\}$$

The configured maximum output power  $P_{CMAX,f,c,NR}(q)$  in physical-channel q for the configured NR carrier shall be set within the bounds:

$$P_{\text{CMAX\_L,f,c,NR}}\left(q\right) \leq \ P_{\text{CMAX,f,c,NR}}\left(q\right) \leq \ P_{\text{CMAX\_H,f,c,NR}}\left(q\right)$$

where  $P_{CMAX\_L,f,c,NR}$  and  $P_{CMAX\_H,f,c,NR}$  are the limits for a serving cell c as specified in clause 6.2.4 of TS 38.101-1 [2] modified as follows:

$$\begin{split} P_{CMAX\_L,f,c,NR} &= MIN \; \{ \; P_{EMAX,\;EN\text{-}DC} \; \; , \\ (P_{PowerClass,\;EN\text{-}DC} - \Delta P_{PowerClass,EN\text{-}DC} \; ), \\ MIN(P_{EMAX,c} \; , \; P_{NR} \; ) \; - \Delta T_{C\_NR,\;c} , \; \; \\ (P_{PowerClass,NR} - \Delta P_{PowerClass,NR}) - MAX(MAX(MPR_c,\;A\text{-}MPR_c) + \Delta T_{IB,c} + \Delta T_{C\_NR,\;c} + \Delta T_{RxSRS}, \; P\text{-}MPR_c) \; \} \end{split}$$

$$P_{CMAX\_H,f,c,NR} = MIN \; \{P_{EMAX,c}, P_{EMAX,EN\text{-}DC} \; \; , \; (P_{PowerClass,EN\text{-}DC} - \Delta P_{PowerClass,EN\text{-}DC} \; ), \; P_{NR} \; , \; P_{PowerClass,NR} - \Delta P_{PowerClass,NR} \; \}$$

For EN-DC with more than one uplink serving cells configured for intra-band UL CA on the NR CG,  $P_{CMAX\_L,f,c,\ NR}$  and  $P_{CMAX\_H,f,c,\ NR}$  are the limits for the NR CG as specified in [2] subclause 6.2A.4 modified by  $P_{NR}$  as follows:

$$\begin{split} P_{CMAX\_L,f,c,NR} &= MIN\{10 \ log_{10} \sum p_{EMAX,c} \ -\Delta T_C \ , \ P_{EMAX,CA}, \ P_{PowerClass} \ -MAX(MPR + A-MPR + \Delta T_{IB,c} + \Delta T_{\_NR \ ,C} + \Delta T_{RxSRS}, P-MPR \ ) \ , \ P_{NR}, \ P_{powerclass,ENDC} \ \} \end{split}$$

$$P_{CMAX\_H,f,c,\textit{NR}} = MIN\{10 \ log_{10} \ \sum p_{EMAX,c} \ , \ P_{EMAX,CA}, \ P_{PowerClass} \ , P_{NR}, \ P_{powerclass,ENDC}\}$$

The lower value between  $P_{PowerClass,\ EN-DC}$  or  $P_{EMAX,\ EN-DC}$  shall not be exceeded at any time by UE.

The total configured maximum transmission power for both synchronous and non-synchronous operation is

$$P_{Total}^{EN-DC} = MIN \ \{ \ P_{EMAX, \, EN-DC} \ , P_{PowerClass, \, EN-DC} - \Delta P_{PowerClass, \, EN-DC} \ \}$$

If the UE does not support dynamic power sharing,

$$P_{Total}^{EN-DC} = MIN \{ P_{EMAX, EN-DC}, P_{PowerClass, EN-DC} - \Delta P_{PowerClass, EN-DC} \} + 0.3 dB$$

If the EN-DC UE does not support dynamic power sharing, then the complete clauses for configured transmitted power for E-UTRA and NR respectively from their own specifications TS 36.101 [4] and TS 38.101-1 [2] respectively apply with the modifications specified above and  $P_{Total}^{EN-DC}$  applies.

When a UE supporting dynamic sharing is configured for overlapping E-UTRA uplink and NR uplink transmissions, the UE can set its configured maximum output power  $P_{CMAX\_E-UTRA,c}$  and  $P_{CMAX\_f,c,NR}$  for the configured E-UTRA and NR uplink carriers, respectively, and its configured maximum transmission power for EN-DC operation,  $\hat{P}_{Total}^{EN-DC}$ , as specified above.

$$P_{UMAX} = 10 \log_{10} \left[ p_{UMAX,c,E-UTRA} + p_{UMAX,c,NR} \right],$$

where  $p_{UMAX,c,E-UTRA}$  and  $p_{UMAX,c,NR}$  denotes the measured output power of serving cell c for E-UTRA and NR respectively, expressed in linear scale.

The measured total configured maximum output power P<sub>UMAX</sub> shall be within the following bounds:

$$P_{CMAX\ L}$$
 - $T_{LOW}$  ( $P_{CMAX\ L}$ )  $\leq P_{UMAX} \leq P_{CMAX\ H} + T_{HIGH}$  ( $P_{CMAX\ H}$ )

with the tolerances T<sub>LOW</sub>(P<sub>CMAX H</sub>) and T<sub>HIGH</sub>(P<sub>CMAX H</sub>) for applicable values of P<sub>CMAX</sub> specified in Table 6.2B.4.1.3-2.

When an UL subframe transmission p from E-UTRA overlap with a physical-channel q from the NR, then for  $P_{\text{UMAX}}$  evaluation, the E-UTRA subframe p is taken as reference period  $T_{\text{REF}}$  and always considered as the reference measurement duration and the following rules are applicable.

 $T_{REF}$  and  $T_{eval}$  are specified in Table 6.2B.4.1.3-1 when same or different subframe and physical-channel durations are used in aggregated carriers.  $P_{PowerClass\,,EN-DC}$  shall not be exceeded by the UE during any evaluation period of time.

For each  $T_{REF}$ , the  $P_{CMAX\_H}$  is evaluated per  $T_{eval}$  and given by the maximum value over the transmission(s) within the  $T_{eval}$  as follows:

While P<sub>CMAX</sub> L is computed as follows:

$$P_{\text{CMAX\_L}} = \text{MIN} \left\{ P_{\text{CMAX\_EN-DC\_L}}(p,q), P_{\text{CMAX\_EN-DC\_L}}(p,q+1), \dots, P_{\text{CMAX\_EN-DC\_L}}(p,q+n) \right\}$$

where  $P_{CMAX\_EN-DC\_L}$  are the applicable lower limits for each overlapping scheduling unit pairs (p,q), (p,q+1), up to (p,q+n) for each applicable  $T_{eval}$  duration, where q+n is the last NR UL physical-channel overlapping with E-UTRA subframe p,

With

$$P_{\text{CMAX\_EN-DC\_H}}(p,q) = \text{MIN } \{10 \log_{10} \left[ p_{\text{CMAX H\_E-UTRA},c}(p) + p_{\text{CMAX H,f,c,NR}}(q) \right], P_{\text{EMAX, EN-DC}}, P_{\text{PowerClass, EN-DC}} \}$$

And:

If the transmissions from NR and E-UTRA do not overlap, then the complete clauses for configured transmitted power for E-UTRA and NR respectively from their own specifications apply with the modifications specified above. The lower value between  $P_{PowerClass,\ NE-DC}$  or  $P_{EMAX,\ NE-DC}$  shall not be exceeded at any time by UE.

 $P_{Total}^{NE-DC} = 10\log 10(\hat{P}_{total}^{NE-DC})$  with  $P_{Total}^{NE-DC}$  the configured maximum transmission power for NE-DC operation as specified in clause 7.6 of TS 38.213 [10].

The total configured maximum transmission power for both synchronous and non-synchronous operation is

$$P_{Total}^{NE-DC} = MIN \{ P_{EMAX, NE-DC}, P_{PowerClass, NE-DC} - \Delta P_{PowerClass, NE-DC} \}$$

If the UE does not support dynamic power sharing,

$$P_{\textit{Total}}^{\textit{NE-DC}} = MIN \; \{ \; P_{\textit{EMAX}, \, \textit{NE-DC}} \; , P_{\textit{PowerClass}, \, \textit{NE-DC}} - \Delta P_{\textit{PowerClass}, \, \textit{NE-DC}} \; \} \; + \; 0.3 \; dB$$

If the NE-DC UE does not support dynamic power sharing, then the complete clauses for configured transmitted power for E-UTRA and NR respectively from their own specifications TS 36.101 [4] and TS 38.101-1 [2] respectively apply with the modifications specified above and  $P_{Total}^{NE-DC}$  applies.

When a UE supporting dynamic sharing is configured for overlapping E-UTRA uplink and NR uplink transmissions, the UE can set its configured maximum output power  $P_{CMAX\_E-UTRA,c}$  and  $P_{CMAX\_f,c,NR}$  for the configured E-UTRA and NR uplink carriers, respectively, and its configured maximum transmission power for NE-DC operation,  $\hat{P}_{Total}^{NE-DC}$ , as specified above.

The measured total maximum output power  $P_{UMAX}$  over both CGs/RATs, measured over the transmission reference time duration is

$$P_{\text{UMAX}} = 10 \log_{10} \left[ p_{\text{UMAX},c,E-UTRA} + p_{\text{UMAX},c,NR} \right],$$

where  $p_{UMAX,c,E-UTRA}$  and  $p_{UMAX,c,NR}$  denotes the measured output power of serving cell c for E-UTRA and NR respectively, expressed in linear scale.

The measured total configured maximum output power P<sub>UMAX</sub> shall be within the following bounds:

$$P_{CMAX\_L} - T_{LOW} \left( P_{CMAX\_L} \right) \\ \leq P_{UMAX} \\ \leq P_{CMAX\_H} + T_{HIGH} \left( P_{CMAX\_H} \right)$$

with the tolerances T<sub>LOW</sub>(P<sub>CMAX\_L</sub>) and T<sub>HIGH</sub>(P<sub>CMAX\_H</sub>) for applicable values of P<sub>CMAX</sub> specified in Table 6.2B.4.1.3a-2.

When an UL subframe transmission p from E-UTRA overlap with a physical-channel q from the NR, then for  $P_{\text{UMAX}}$  evaluation, the E-UTRA subframe p is taken as reference period  $T_{\text{REF}}$  and always considered as the reference measurement duration and the following rules are applicable.

 $T_{\text{REF}}$  and  $T_{\text{eval}}$  are specified in Table 6.2B.4.1.3a-1 when same or different subframe and physical-channel durations are used in aggregated carriers.  $P_{\text{PowerClass}}$ ,  $N_{\text{E-DC}}$  shall not be exceeded by the UE during any evaluation period of time.

Table 6.2B.4.1.3a-1: P<sub>CMAX</sub> evaluation window

Different transmission duration in	LTE Subframe	Min( <i>T</i> <sub>no_hopping</sub> , Physical
different RAT carriers	LIE Subitame	Channel Length

For each  $T_{REF}$ , the  $P_{CMAX\_H}$  is evaluated per  $T_{eval}$  and given by the maximum value over the transmission(s) within the  $T_{eval}$  as follows:

$$P_{\text{CMAX\_H}} = \text{MAX} \left\{ P_{\text{CMAX\_NE-DC\_H}}(p,q), P_{\text{CMAX\_NE-DC\_H}}(p,q+1), \dots, P_{\text{CMAX\_NE-DC\_H}}(p,q+n) \right\}$$

where  $P_{\text{CMAX\_NE-DC\_H}}$  are the applicable upper limits for each overlapping scheduling unit pairs (p,q), (p,q+1), up to (p,q+n) for each applicable  $T_{\text{eval}}$  duration, where q+n is the last NR UL physical-channel overlapping with LTE subframe p.

While P<sub>CMAX\_L</sub> is computed as follows:

$$P_{\text{CMAX\_L}} = \text{MIN} \left\{ P_{\text{CMAX\_NE-DC\_L}}(p,q), P_{\text{CMAX\_NE-DC\_L}}(p,q+1), \dots, P_{\text{CMAX\_NE-DC\_L}}(p,q+n) \right\}$$

where  $P_{\text{CMAX\_NE-DC\_L}}$  are the applicable lower limits for each overlapping scheduling unit pairs (p,q), (p,q+1), up to (p,q+n) for each applicable  $T_{\text{eval}}$  duration, where q+n is the last NR UL physical-channel overlapping with LTE subframe p,

With

$$P_{\text{CMAX\_NE-DC\_H}}(p,q) = \text{MIN } \{10 \; \log_{10} \left[ p_{\text{CMAX H\_E-UTRA},c}(p) + p_{\text{CMAX H,f,c,NR}}(q) \right], \; P_{\text{EMAX\_NE-DC}}, \; P_{\text{PowerClass, NE-DC}} \} \}$$

And:

$$a = 10 \log_{10} \left[ p_{\text{CMAX\_E-UTRA},c}(p) + p_{\text{CMAX,f,c,NR}}(q) \right] > P_{Total}^{NE-DC}$$

If a = TRUE

$$P_{\text{CMAX\_NE-DC\_L}}(p,q) = \text{MIN} \left\{ 10 \log_{10} \left[ p_{\text{CMAX L\_E-UTRA},c}(p) \right], P_{\text{EMAX, NE-DC}}, P_{\text{PowerClass, NE-DC}} \right\}$$

Else

 $P_{\text{CMAX\_NE-DC\_L}}(p,q) = \text{MIN} \left\{ 10 \; \text{log}_{10} \left[ p_{\text{CMAX} \; \text{L\_E-UTRA},c} \left( p \right) + p_{\text{CMAX} \; \text{L,f,c,NR}} \left( q \right) \right], \; P_{\text{EMAX, NE-DC}}, P_{\text{PowerClass, NE-DC}} \right\}$  where

- p<sub>CMAX H E-UTRA,c</sub> (p) is the E-UTRA higher limit of the maximum configured power expressed in linear scale;

- $p_{CMAX L,f,c,NR}(q)$  is the NR lower limit of the maximum configured power expressed in linear scale;
- P<sub>PowerClass, NE-DC</sub> is defined in clause 6.2B.1.3a for inter-band NE-DC;
- $p_{CMAX\_E-UTRA,c}(p)$  is the linear value of  $P_{CMAX\_E-UTRA,c}(p)$ , the real configured max power for E-UTRA
- p<sub>CMAX,f,c,NR</sub> (q) is the linear value of P<sub>CMAX,f,c,NR</sub> (q), the real configured max power of NR

with the tolerances T<sub>LOW</sub> and T<sub>HIGH</sub> for applicable values of P<sub>CMAX</sub> specified in Table 6.2B.4a.1.3-2.

When LTE and NR transmissions overlap and the condition a = FALSE), then  $P_{UMAX}$ , under nominal conditions, shall be within the following bounds:

$$P_{CMAX\_L} - T_{LOW} \left( P_{CMAX\_L} \right) \, \leq \, P_{UMAX} \, \leq \, P_{CMAX\_H} + T_{HIGH} \left( P_{CMAX\_H} \right)$$

The measured total maximum output power P<sub>UMAX</sub> over both the E-UTRA uplink and NR V2X carriers is

$$P_{UMAX} = 10 log_{10} [p_{UMAX,c,Uu} + p_{UMAX,c,V2X}],$$

where  $p_{UMAX,c,Uu}$  denotes the measured output power of serving cell c for the configured E-UTRA uplink carrier or NR uplink carrier, and  $p_{UMAX,c,V2X}$  denotes the measured output power for the configured NR V2X SL carrier or E-UTRA V2X SL carrier expressed in linear scale.

When a UE is configured for synchronous V2X sidelink and uplink transmissions,

$$\mathsf{P}_{\mathsf{CMAX\_L}}(p,\,q) \ - \ \mathsf{T}_{\mathsf{LOW}}\left(\mathsf{P}_{\mathsf{CMAX\_L}}(p,\,q)\right) \ \leq \ \mathsf{P}_{\mathsf{UMAX}} \ \leq \ \mathsf{P}_{\mathsf{CMAX\_H}}(p,\,q) \ + \ \mathsf{T}_{\mathsf{HIGH}}\left(\mathsf{P}_{\mathsf{CMAX\_H}}(p,\,q)\right)$$

where  $P_{CMAX\_L}(p,q)$  and  $P_{CMAX\_H}(p,q)$  are the limits for the pair (p,q) and with the tolerances  $T_{LOW}(P_{CMAX})$  and  $T_{HIGH}(P_{CMAX})$  for applicable values of  $P_{CMAX}$  specified in Table 6.2C.4-1.  $P_{CMAX\_L}$  may be modified for any overlapping portion of slots (p,q) and (p+1,q+1).

## 6.3 Output power dynamics

Output power dynamics for EN-DC operations in FR1 and FR2 as specified in TS 38.101-1 [2] and TS 38.101-2 [3], respectively. E-UTRA as specified in TS 36.101 [4]. For intra-band contiguous EN-DC operation in FR1, minimum output power requirements specified in clause 6.3.1 of TS 38.101-1 [2] and clause 6.3.2 of TS 36.101 [4] shall only apply when the power of all NR and E-UTRA carriers are set to minimum value. Similarly, OFF power requirements specified in clause 6.3.2 of TS 38.101-1 [2] and clause 6.3.3 of TS 36.101 [4] shall only apply when the power of all NR and E-UTRA carriers are OFF. The OFF power condition in transmit ON/OFF time mask requirements specified in clause 6.3.3 of TS 38.101-1 [2] and clause 6.3.4 of TS 36.101 [4] is applicable only when all NR and E-UTRA carriers are OFF. If both E-UTRA and NR transition between ON and OFF states simultaneously, the longer transient time shall apply to both. If either E-UTRA or NR is OFF and the other carrier transitions from OFF to ON, then the transiet time associated with that carrier applies.

## 6.3A Output power dynamics for CA

For inter-band NR CA between FR1 and FR2, output power dynamics as specified in TS 38.101-1 [2] and TS 38.101-2 [3] apply for FR1 and FR2 respectively.

## 6.3B Output power dynamics for DC

#### 6.3B.0 General

The E-UTRA and NR switching time mask defines the observation period between E-UTRA subframe and NR slot/mini-slot boundary. Both E-UTRA subframe and NR slot/mini-slot have ON power transmissions. The ON power is defined as the mean power over the symbol duration excluding any transient period. For E-UTRA subframe or NR slot/mini-slot having OFF power transmission, the general time mask for E-UTRA or NR shall apply.

For inter-band EN-DC, output power dynamics requirement for E-UTRA single carrier and CA operation specified in clauses 6.3 of TS 36.101 [4] and for NR single carrier and CA operation specified in clause 6.3 of TS 38.101-1 [2] and clause 6.3, 6.3A and 6.3D of TS 38.101-2 [3] apply.

# 6.3B.1 Output power dynamics for EN-DC with UL sharing from UE perspective

# 6.3B.1.1 E-UTRA and NR switching time mask for TDM based UL sharing from UE perspective

The E-UTRA and NR switching time mask is applicable for non-simultaneous transmissions between E-UTRA and NR in TDM based UL sharing from the UE perspective in the same channel, which is shared by E-UTRA and NR. The requirement applies on the condition that UE is capable of handling the uplink transmission timing difference between E-UTRA and NR which is less than or equal to [2.21]µs.

For UEs reporting E-UTRA and NR switching time capability of type 1 with switching time < 0.5 us for TDM based UL sharing from UE perspective within FR1 time masks in Figure 6.3B.1.1-1 and Figure 6.3B.1.1-2 shall apply. For UEs reporting E-UTRA and NR switching time capability of type 2 with switching time < 20 us for TDM based UL sharing from UE perspective within FR1, time masks in Figure 6.3B.1.1-3 and Figure 6.3B.1.1-4 shall apply. The additional time for the transient period on the succeeding E-UTRA subframe or NR slot is caused by the uplink transmission timing difference, for which the maximum value is  $[2.21]\mu s$ .

The UE shall support the switch between single layer transmission with one antenna port and two-layer transmission with two antenna ports on the two uplink carriers following the scheduling commands and rank adaptation, i.e., both single layer and two-layer transmission with 2 antenna ports, and single layer transmission with 1 antenna port shall be supported on NR UL carrier 2.

The switching periods described in Figure 6.3B.4.1-1 are only located in NR carrier, and the length of uplink switching period *X* is less than the value indicated by UE capability *uplinkTxSwitchingPeriod*.

### 6.5B.2 Out-of-band emissions for DC

#### 6.5B.2.1 Intra-band contiguous EN-DC

The out of band emissions are unwanted emissions immediately outside the EN-DC aggregated channel bandwidth resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit is specified in terms of a spectrum emission mask and an adjacent channel leakage power ratio.

Unless otherwise stated, the OOBE limits specified for the DC combination in this clause supercede any OOBE requirements specified for each sub-block in the respective TS [4] and TS 38.101-1 [2].

The requirements apply to the sum of transmissions across all antenna connectors.

#### 6.5B.2.1.1 Spectrum emissions mask

The spectrum emission mask of the UE applies to frequencies ( $\Delta f_{OOB}$ ) starting from the  $\pm$  edge of the EN-DC aggregated channel bandwidth. For frequencies offset greater than  $\Delta f_{OOB}$  as specified in Table 6.5B.2.1.1-1 the spurious requirements in clause 6.5B.3 are applicable.

The general spectrum emission for intra-band contiguous EN-DC is specified in Table 6.5B.2.1.1-1.

The power of any UE emission shall not exceed the levels specified in Table 6.5B.2.1.1-1 for the specified EN-DC aggregated channel bandwidth.

Table 6.5B.2.1.1-1: General spectrum emission mask for intra-band contiguous EN-DC

Δf <sub>OOB</sub> (MHz)	Spectrum emission limit (dBm)	Measurement bandwidth	
± 0 - 1	Max(Round(10*log(0.15/ENBW)),-24)	30 kHz	
±1-5	-10	1 MHz	
± 5 - ENBW	-13	1 MHz	
± ENBW – (ENBW+5)	-25	1 MHz	
NOTE: ENBW refers to th	e aggregated channel bandwidth in MHz as de	fined in clause	
5.3B.			

#### 6.5B.2.1.2 Additional spectrum emissions mask

#### 6.5B.2.1.2.1 Requirements for network signalled value "NS\_35"

When NS\_35 is indicated in the MCG and NS\_35 is indicated in the SCG, the requirements in Table 6.5B.2.1.2.1-1 apply in the frequency ranges immediately adjacent and outside the aggregated sub-blocks of the EN-DC configuration for DC\_(n)71AA.

Table 6.5B.2.1.2.1-1: Additional requirements

Δf <sub>OOB</sub> (MHz)	Frequency offset of measurement filter centre frequency, f_offset	Minimum requirement (dBm)	Measurement bandwidth
$0 \text{ MHz} \leq \Delta f < 0.1 \text{ MHz}$	0.015 MHz ≤ f_offset < 0.085 MHz	-13	30 kHz
$0.1 \text{ MHz} \leq \Delta f < \text{ENBW}$	0.15 MHz ≤ f_offset < ENBW - 0.05 MHz	-13	100 kHz
ENBW $\leq \Delta f < ENBW + 5 MHz$	ENBW+0.5 MHz ≤ f_offset < ENBW + 4.5 MHz	-25	1 MHz

NOTE 1: ENBW is the aggregated bandwidth of an E-UTRA sub-block and an adjacent NR sub-block; there is no frequency separation between the said sub-blocks. The sub-block bandwidths include any internal guard bands.

#### 6.5B.2.1.2.2 Requirements for network signalled value "NS\_04"

Additional spectrum emission requirements are signalled by the network to indicate that the UE shall meet an additional requirement for a specific deployment scenario as part of the cell handover/broadcast message.

The Band 41/n41 SEM transition point from -13 dBm/MHz to -25 dBm/MHz is based on the emission bandwidth. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power. Since the 26 dB emission bandwidth is implementation dependent, the transmission bandwidths occupied by RBs is used for the SEM. The emission bandwidth for E-UTRA carriers is document in TS 36.101 [4], and the emission bandwidth for NR carriers is documented in TS 38.101-1 [2]. The total emission bandwidth for contiguous intra-band EN-DC is the sum of the emission bandwidth for each CC plus the guard band between contiguous CCs.

When "NS\_04" is indicated in the cell, the power of any UE emission shall not exceed the levels specified in Table 6.5B.2.1.2.2-1.

Table 6.5B.2.1.2.2-1: DC\_(n)41 SEM with NS\_04

±0-1				-1	10	1 MHz		
± 1 - 5								
± 5 - X			1 MHz					
± X - (ENBW + 5 MHz)			-25					

NOTE: X is defined as the sum of the emission bandwidth of the component carriers plus the guard band between contiguous CCs.

#### 6.5B.2.1.3 Adjacent channel leakage ratio

For EN-DC operation with an E-UTRA sub-block immediately adjacent to an NR sub-block, the ACLR is defined as the ratio of the filtered mean power centred on the aggregated sub-block bandwidth ENBW to the filtered mean power centred on an adjacent bandwidth of the same size ENBW at nominal channel spacing. The UE shall meet the ACLR minimum requirement EN-DC<sub>ACLR</sub> specified in Table 6.5B.2.1.3-1 with ENBW the sum of the sub-block bandwidths.

The assigned channel power and adjacent channel power are measured with rectangular filters with measurement bandwidths specified in 6.5B.2.1.3-1.

EN-DC <sub>ACLR</sub> for PC2	dBc	31

#### 6.5B.2.2 Intra-band non-contiguous EN-DC

#### 6.5B.2.2.1 Spectrum emissions mask

The spectral emission mask for intra-band non-contiguous EN-DC is a composite of the emission mask for each CC with the level set to the maximum value from each mask for each frequency outside of the transmission bandwidth of either carrier. A composite spectrum emission mask is a combination of individual CC spectrum emissions masks. Where two masks overlap the most relaxed limit is used. Composite spectrum emission mask applies to frequencies up to  $\pm \Delta f_{OOB}$  starting from the edges of the sub-blocks. If for some frequency an individual CC spectrum emission mask overlaps with the bandwidth of another CC then the emission mask does not apply for that frequency.

#### 6.5B.2.2.2 Additional spectrum emissions mask

When additional spectrum emission mask or masks apply, the additional SEM(s) shall be used to calculate the composite SEM described in 6.5B.2.2.1.

#### 6.5B.2.2.3 Adjacent channel leakage ratio

For intra-band non-contiguous EN-DC, the EN-DC Adjacent Channel Leakage power Ratio (EN-DC<sub>ACLR</sub>) is the ratio of the sum of the filtered mean powers centred on the assigned E-UTRA and NR sub-block frequencies to the filtered mean power centred on an adjacent channel frequency at nominal channel spacing. In case the sub-block gap bandwidth Wgap is smaller than a E-UTRA or NR sub-block bandwidth, no EN-DC<sub>ACLR</sub> requirement is set for the corresponding sub-block for the gap. The assigned EN-DC sub-block power and adjacent channel power are measured with rectangular filters with measurement bandwidths specified in TS 36.101 [4] for the E-UTRA sub-block, and TS 38.101-1 [2], TS 38.101-2 [3] for the NR sub-block. If the measured adjacent channel power is greater than -50dBm then the EN-DC<sub>ACLR</sub> shall be higher than the value specified in for E-UTRA<sub>ACLR</sub> and NR<sub>ACLR</sub>.

## 6.5B.3 Spurious emissions for DC

#### 6.5B.3.1 Intra-band contiguous EN-DC

The general spurious emissions requirements specified in clause 6.6.3.1 of TS 36.101 [4] and clause 6.5.3.1 of TS 38.101-1 [2] apply beyond any frequencies for which the out-of-band emissions requirements in clause 6.5B.2.1apply.

#### 6.5B.3.1.2 Spurious emission band UE co-existence

The requirements in Table 6.5B.3.1.2-1 apply on each component carrier with all component carriers are active.

NOTE 1: FDL\_low and FDL\_high refer to each E-UTRA frequency band specified in Table 5.5-1

NOTE 2: As exceptions, measurements with a level up to the applicable requirements defined in Table 6.6.3.1-2 are permitted for each assigned E-UTRA carrier used in the measurement due to 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup> or 5<sup>th</sup> harmonic spurious emissions. Due to spreading of the harmonic emission the exception is also allowed for the first 1 MHz frequency range immediately outside the harmonic emission on both sides of the harmonic emission. This results in an overall exception interval centred at the harmonic emission of (2 MHz + N x L<sub>CRB</sub> x 180 kHz), where N is 2, 3, 4, 5 for the 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup> or 5<sup>th</sup> harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval

NOTE 3: These requirements also apply for the frequency ranges that are less than F<sub>OOB</sub> (MHz) in Table 6.6.3.1-1 and Table 6.6.3.1A-1 [4] from the edge of the channel bandwidth.

NOTE4: Applicable when co-existence with PHS system operating in 1884.5 - 1915.7 MHz.

NOTE: To simplify the above Table, E-UTRA band numbers are listed for bands which are specified only for E-UTRA operation or both E-UTRA and NR operation. NR band numbers are listed for bands which are specified only for NR operation.

### 6.5B.3.2 Intra-band non-contiguous EN-DC

If for some frequency an individual CC spurious emission requirement overlaps with the general spectrum emission mask or the bandwidth of another CC then it does not apply.

#### 6.5B.3.3 Inter-band EN-DC within FR1

#### 6.5B.3.3.1 General spurious emissions

The general spurious emissions requirements specified in clause 6.6.3.1 of TS 36.101 [4], clause 6.5.3.1 of TS 38.101-1 [2] and TS 38.101-2 [3] apply for each component carrier. For the case of inter-band EN-DC with a single carrier per cell group, the general spurious emissions requirements also apply with both downlink carrier and both both uplink carriers active. Limits on configured maximum output power for the uplink according to clause 6.2B.4 apply.

NOTE: The general spurious emission requirements with both uplink carriers active are allowed to be verified for only a single inter-band EN-DC configuration per NR band. Furthermore, the requirements are allowed to be verified by measuring spurious emissions at the specific frequencies where second and third order intermodulation products generated by the two transmitted carriers can occur.

## 6.5B.3.3.2 Spurious emission band UE co-existence

This clause specifies the requirements for the specified EN-DC, for coexistence with protected bands. The requirements in Table 6.5B.3.3.2-1 apply on each component carrier with all component carriers are active.

NOTE: For inter-band EN-DC with uplink assigned to one LTE band and one NR band the requirements in Table 6.5B.3.3.2-1 could be verified by measuring spurious emissions at the specific frequencies where second and third order intermodulation products generated by the two transmitted carriers can occur;

- NOTE 1: FDL low and FDL high refer to each E-UTRA frequency band specified in Table 5.5-1 in TS 36.101 [4].
- NOTE 2: As exceptions, measurements with a level up to the applicable requirements defined in Table 6.6.3.1-2 are permitted for each assigned E-UTRA carrier used in the measurement due to 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup> or 5<sup>th</sup> harmonic spurious emissions. Due to spreading of the harmonic emission the exception is also allowed for the first 1 MHz frequency range immediately outside the harmonic emission on both sides of the harmonic emission. This results in an overall exception interval centred at the harmonic emission of (2 MHz + N x L<sub>CRB</sub> x 180 kHz), where N is 2, 3, 4, 5 for the 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup> or 5<sup>th</sup> harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval.
- NOTE 3: Applicable when co-existence with PHS system operating in 1884.5 1915.7 MHz
- NOTE 4: Void
- NOTE 5: These requirements also apply for the frequency ranges that are less than F<sub>OOB</sub> (MHz) in Table 6.6.3.1-1 and Table 6.6.3.1A-1 from the edge of the channel bandwidth.
- NOTE 6: This requirement is applicable for any channel bandwidths within the range 2500 2570 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 2560.5 2562.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 2552 2560 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB.
- NOTE 7: For these adjacent bands, the emission limit could imply risk of harmful interference to UE(s) operating in the protected operating band.
- NOTE 8: This requirement is applicable for any channel bandwidths within the range 1920 1980 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 1927.5 1929.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 1930 1938 MHz the requirement is applicable only for an uplink
- NOTE 9: Applicable when the assigned E-UTRA carrier is confined within 718 MHz and 748 MHz and when the channel bandwidth used is 5 or 10 MHz.
- NOTE 10: As exceptions, measurements with a level up to the applicable requirement of -38 dBm/MHz is permitted for each assigned E-UTRA carrier used in the measurement due to 2<sup>nd</sup> harmonic spurious emissions. An exception is allowed if there is at least one individual RB within the transmission bandwidth (see Figure 5.6-1) for which the 2nd harmonic totally or partially overlaps the measurement bandwidth (MBW).
- NOTE 11: As exceptions, measurements with a level up to the applicable requirement of -36 dBm/MHz is permitted for each assigned E-UTRA carrier used in the measurement due to 3<sup>rd</sup> harmonic spurious emissions. An exception is allowed if there is at least one individual RB within the transmission bandwidth (see Figure 5.6-1) for which the 3<sup>rd</sup> harmonic totally or partially overlaps the measurement bandwidth (MBW).
- NOTE 12: This requirement is applicable only for the following cases: A: for carriers of 5 MHz channel bandwidth when carrier centre frequency (Fc) is within the range 902.5 MHz ≤ Fc < 907.5 MHz with an uplink transmission bandwidth less than or equal to 20 RB; B: for carriers of 5 MHz channel bandwidth when carrier centre frequency (Fc) is within the range 907.5 MHz ≤ Fc ≤ 912.5 MHz without any restriction on uplink transmission bandwidth; C: for carriers of 10 MHz channel bandwidth when carrier centre frequency (Fc) is Fc = 910 MHz with an uplink transmission bandwidth less than or equal to 32 RB with RB<sub>start</sub> > 3.
- NOTE 13: Void
- NOTE 14: This requirement is applicable for 5 and 10 MHz E-UTRA channel bandwidth allocated within 718-728MHz. For carriers of 10 MHz bandwidth, this requirement applies for an uplink transmission bandwidth less than or equal to 30 RB with RB<sub>start</sub> > 1 and RB<sub>start</sub> < 48.
- NOTE 15: Void
- NOTE 16: This requirement is applicable for any channel bandwidths within the range 1920 1980 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 1927.5 1929.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 1930 1938 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB.
- NOTE 17: This requirement is applicable in the case of a 10 MHz E-UTRA carrier confined within 703 MHz and 733 MHz, otherwise the requirement of -25 dBm with a measurement bandwidth of 8 MHz applies.
- NOTE 18: This requirement is only applicable for E-UTRA carriers with bandwidth confined within 1885 1920 MHz (requirement for carriers with at least 1RB confined within 1880 1885 MHz is not specified). This requirement applies for an uplink transmission bandwidth less than or equal to 54 RB for E-UTRA carriers of 15 MHz bandwidth when carrier center frequency is within the range 1892.5 1894.5 MHz and for E-UTRA carriers of 20 MHz bandwidth when carrier center frequency is within the range 1895 1903 MHz.

# 6.5B.4 Additional spurious emissions

#### 6.5B.4.1 General

These requirements are specified in terms of an additional spectrum emission requirement. Additional spurious emission requirements are signalled by the network to indicate that the UE shall meet an additional requirement for a specific deployment scenario as part of the cell handover/broadcast message.

NOTE: For measurement conditions at the edge of each frequency range, the lowest frequency of the measurement position in each frequency range should be set at the lowest boundary of the frequency range plus MBW/2. The highest frequency of the measurement position in each frequency range should be set at the highest boundary of the frequency range minus MBW/2. MBW denotes the measurement bandwidth defined for the protected band.

### 6.5B.4.1.1 Minimum requirement (network signalled value "NS\_04")

When "NS 04" is indicated in the cell, the power of any UE emission shall not exceed the levels specified in Table 6.5B.4.1.1-1. This requirement also applies for the frequency ranges that are less than  $F_{OOB}$  (MHz) in Table 6.6.3.1-1 from the edge of the channel bandwidth.

# 7 Receiver characteristics

# 7.1 General

Unless otherwise stated the receiver characteristics are specified at the antenna connector(s) of the UE for the bands operating on frequency range 1 and over the air of the UE for the bands operating on frequency range 2. The requirements for frequency range 1 and frequency range 2 can be verified separately. For the carrier in frequency range 1, requirements can be verified with NR FR2 link disabled. For the carrier in frequency range 2, requirements can be verified in OTA mode with E-UTRA connecting to the network by OTA without calibration.

The requirements defined in this clause are the extra requirements compared with the single carrier requirements defined in TS 38.101-1 [2] and TS 38.101-2 [3].

Unless otherwise stated, the UL and DL reference measurement channels are the same with the configurations specified in TS 38.101-1 [2] and TS 38.101-2 [3].

Unless otherwise stated, requirements for NR receiver written in TS 38.101-1 [2] and TS 38.101-2 [3] apply and are assumed anchor agnostic. Requirements are verified under conditions where anchor resources do not interfere NR operation.

For intra-band non-contiguous EN-DC, the output power is configured as follows:

- One E-UTRA uplink carrier with the output power set to 4dB Below P<sub>CMAX\_L</sub> and the NR band whose downlink is being tested has its uplink carrier output power set to minimum output power as defined in clause 6.3.1 of TS 38.101-1 [2].
- One NR uplink carrier with the output power set to 4dB Below P<sub>CMAX\_L</sub> and the E-UTRA band whose downlink is being tested has its uplink carrier output power set to minimum output power as defined in clause 6.3.2.1 of TS 36.101 [4].

For the additional requirements for intra-band non-contiguous EN-DC of two sub-blocks, an in-gap test refers to the case when the interfering signal is located at a negative offset with respect to the assigned lowest channel frequency of the highest sub-block and located at a positive offset with respect to the assigned highest channel frequency of the lowest sub-block.

For the additional requirements for intra-band non-contiguous EN-DC of two sub-blocks, an out-of-gap test refers to the case when the interfering signal(s) is (are) located at a positive offset with respect to the assigned channel frequency of the highest carrier frequency or located at a negative offset with respect to the assigned channel frequency of the lowest carrier frequency.

For the additional requirements for intra-band non-contiguous EN-DC of two sub-blocks with channel bandwidth larger than or equal to 5 MHz, the existing adjacent channel selectivity requirements, in-band blocking requirements (for each case), and narrow band blocking requirements apply for in-gap tests only if the corresponding interferer frequency offsets with respect to the two measured carriers satisfy the following condition in relation to the sub-block gap size  $W_{\rm gap}$  for at least one of the E-UTRA or NR sub-blocks, so that the interferer frequency position does not change the nature of the core requirement tested:

$$W_{gap} \ge 2 \cdot |FInterferer (offset)| - BW_{Channel}$$

For the E-UTRA sub-block, the  $F_{Interferer \, (offset)}$ , for a sub-block with a single component carrier is the interferer frequency offset with respect to carrier as specified in clause 7.5.1, clause 7.6.1 and clause 7.6.3 for the respective requirement in TS 36.101 [4] and  $BW_{Channel}$ .  $F_{Interferer \, (offset)}$  for the E-UTRA sub-block with two or more contiguous component carriers is the interference frequency offset with respect to the carrier adjacent to the gap is specified in clause 7.5.1A, 7.6.1A and 7.6.3A in TS 36.101 [4].

For the NR sub-block, the  $F_{\text{Interferer (offset)}}$ , for a sub-block with a single component carrier is the interferer frequency offset with respect to carrier as specified in clause 7.5.1, clause 7.6.1 and clause 7.6.3 for the respective requirement in TS 38.101-1 [2] and  $BW_{\text{Channel}}$ .

The interferer frequency offsets for adjacent channel selectivity, each in-band blocking case and narrow-band blocking shall be tested separately with a single in-gap interferer at a time.

For sub-clauses with suffix A or B: the minimum requirements for band combinations including Band n41 also apply for the corresponding band combinations with Band n90 replacing Band n41 but with otherwise identical parameters. For brevity the said band combinations with Band n90 are not listed in the tables below but are covered by this specification.

# 7.3A Reference sensitivity for CA

## 7.3A.1 General

For NR CA operation NR single carrier REFSENS requirements defined in TS 38.101-1 [2] and TS 38.101-2 [3] apply to all downlink bands part of NR CA configurations listed in Table 5.2A.1-1unless sensitivity degradation is allowed as defined in clause 7.3A.

# 7.3A.2 Reference sensitivity power level for CA

## 7.3A.3 $\Delta R_{IB.c}$ for CA

For the UE which supports inter-band NR CA configuration, the minimum requirement for reference sensitivity in clause 7.3.2, 7.3A2 in TS 38.101-1 [2] and clause 7.3.2, 7.3A.2in TS 38.101-2 [3] shall be increased by the amount given in  $\Delta R_{IB,c}$  in Tables below. Unless otherwise stated,  $\Delta R_{IB,c}$  is set to zero.

In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then

When the operating band frequency range is  $\leq$  1GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the average value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum  $\Delta R_{IB,c}$  among the different supported band combinations involving such band shall be applied

- When the operating band frequency range is > 1 GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the maximum value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3] for the applicable operating bands.

#### 7.3A.3.1 $\Delta R_{IB,c}$ for Inter-band CA between FR1 and FR2

 $\Delta R_{IB,c}$  is independent between FR1 and FR2. For inter-band CA between FR1 and FR2,  $\Delta R_{IB,c}$  for the FR1 band(s) from TS 38.101-1 [2] applies and  $\Delta R_{IB,c}$  for the FR2 NR band(s) is set to zero. Otherwise  $\Delta R_{IB,c}$  is set to zero.

# 7.3B Reference sensitivity level for DC

#### 7.3B.1 General

For EN-DC, E-UTRA and NR single carrier, CA, and MIMO operation of REFSENS requirements defined in TS 38.101-1 [2], TS 38.101-2 [3] and TS 36.101 [4] apply to all downlink bands of EN-DC configurations listed in clause 5.5B, unless sensitivity degradation exception is allowed in this clause of this specification, clause 7.3 in TS 38.101-1 [2], clause 7.3 in TS 38.101-2 [3] or clause 7.3 in TS 36.101 [4]. Allowed exceptions specified in this clause also apply to any higher order EN-DC configuration combination containing one of the band combinations that exception is allowed for. Reference sensitivity exeptions are specified by applying maximum sensitivity degradation (MSD) into applicaple REFSENS requirement. EN-DC REFSENS requirements shall be met for NR uplink transmissions using QPSK DFT-s-OFDM waveforms as defined in clause 7.3.2 [2]. Unless otherwise specified UL allocation uses the lowest SCS allowable for a given channel BW. Limits on configured maximum output power for the uplink according to clause 6.2B.4 shall apply.

In case of interband EN-DC the receiver REFSENS requirements in this clause do not apply for 1.4 and 3 MHz E-UTRA carriers. For the case of inter-band EN-DC with a single carrier per cell group and multi carrier per cell group, in addition to the E-UTRA and NR single carrier, CA, and MIMO operation of REFSENS requirements defined in TS 38.101-1 [2], TS 38.101-2 [3], and TS 36.101 [4], the REFSENS requirements specified therein also apply with both downlink carriers and both uplink carriers active unless sensitivity exceptions are allowed in this clause of this specification, clause 7.3 in TS 38.101-1 [2] or clause 7.3 in TS 36.101 [4].

NOTE: For inter-band EN-DC, the reference sensitivity requirement with both uplink carriers active is allowed to be verified for only a single inter-band EN-DC configuration per NR band.

# 7.3B.2 Reference sensitivity for DC

#### 7.3B.2.1 Intra-band contiguous EN-DC

For intra-band contiguous EN-DC configurations, the reference sensitivity power level REFSENS is the minimum mean power applied to each one of the UE antenna ports at which the throughput for the carrier(s) of the E-UTRA and NR CGs shall meet or exceed the requirements for the specified E-UTRA and NR reference measurement channels. The reference sensitivity requirements apply with all uplink carriers and all downlink carriers active for EN-DC configuration and Uplink EN-DC configuration listed in Table 5.5B.2-1 and Table 5.5B.3-1, as supported by the UE. For EN-DC configurations where uplink is not available in either the MCG or the SCG or for EN-DC configurations where the UE only supports single uplink operation, reference sensitivity requirements apply with single uplink transmission. The downlink carrier(s) from the cell group with uplink shall be configured closer to the uplink operating band than any of the downlink carriers from the cell group without uplink.

Sensitivity degradation is allowed for Intra-band contiguous EN-DC configurations listed in Table 7.3B.2.1-1 the reference sensitivity is defined only for the specific uplink and downlink test points which are specified in Table 7.3B.2.1-1 and E-UTRA and NR single carrier requirements do not apply.

NOTE 2: The transmitters powers shall be set to P<sub>UMAX</sub>, as defined in TS 38.101-1 [2], TS 38.101-2 [3], and TS 36.101 [4], with additional limits on configured maximum output power for the uplink according to clause 6.2B.4.

## 7.3B.2.2 Intra-band non-contiguous EN-DC

For intra-band non-contiguous EN-DC configurations, the reference sensitivity power level REFSENS is the minimum mean power applied to each one of the UE antenna ports at which the throughput for the carrier(s) of the E-UTRA and NR CGs shall meet or exceed the requirements for the specified E-UTRA and NR reference measurement channels.

Sensitivity degradation is allowed for Intra-band non-contiguous EN-DC configurations listed in Table 7.3B.2.2-1, the reference sensitivity is defined only for the specific uplink and downlink test points which are specified in Table 7.3B.2.2-1 and E-UTRA and NR single carrier requirements do not apply.

- NOTE 10: Applicable for the operations with 2 or 4 antenna ports supported in the band with carrier aggregation configured.
- NOTE 11: These requirements apply when the lower edge frequency of the 5 MHz uplink channel in Band 71 is located at or below 668 MHz and the downlink channel in Band 2 is located with its upper edge at 1990 MHz.
- NOTE 12: These requirements apply when the lower edge frequency of the 10 MHz, 15 MHz, or 20 MHz uplink channel in Band 71 is located at or below 668 MHz and the downlink channel in Band 2 is located with its upper edge at 1990 MHz.
- NOTE 13: These requirements apply when there is at least one individual RE within the uplink transmission bandwidth of the aggressor (lower) band for which the 2nd transmitter harmonic is within the downlink transmission bandwidth of a victim (higher) band and a range ΔF<sub>HD</sub> above and below the edge of this downlink transmission bandwidth. The value ΔF<sub>HD</sub> depends on the EN-DC band combination: ΔF<sub>HD</sub> = 10 MHz for DC\_1\_n77, DC\_2\_n48, DC\_2\_n77, DC\_48\_n66, DC\_66\_n48, DC\_66\_n77, DC\_3\_n77, DC\_3\_n78, DC\_11\_n28 and DC\_28\_n50, DC\_28\_n51, DC\_66\_n78.
- NOTE 14: No requirements apply when there is at least one individual RE within the uplink transmission bandwidth of the low band for which the 2nd transmitter harmonic is within the downlink transmission bandwidth of the high band. The reference sensitivity for all active downlink component carriers is only verified when this is not the case (the requirements specified in clause 7.3.1 from TS 36.101-1 apply unless otherwise specified).
- NOTE 15: MSD test point can be chosen according to supported BW and lowest SCS supported by the UE.

NOTE 1: The UL configuration applies regardless of the channel bandwidth of the UL band. UL resource blocks allocation in the table shall be further limited to that specified in Table 7.3.1-2 in TS 36.101 [4] or Table 7.3.2-3 in TS 38.101-1 [2].

NOTE 2: The UL resource blocks shall be located as close as possible to the downlink operating band but confined within the transmission bandwidth configuration for the channel bandwidth.

NOTE 3: When the maximum UL RB allocation "Lcrb" value is less than the maximum transmission bandwidth configuration "Nrb" defined in Table 5.3.2-1 in 38.101-1 [2] for the specified UL band SCS, the UL band should be configured using the lowest CBW that is compatible with the maximum specified Lcrb value.

NOTE 4: If the aggressor band is NR band, the test SCS and UL RB can be adjusted according to supported BW and lowest SCS supported by the UE.

# 7.3B.2.3.5 MSD for intermodulation interference due to dual uplink operation for EN-DC in NR FR1

For EN-DC configurations in NR FR1 the UE may indicate capability of not supporting simultaneous dual uplink operation due to possible intermodulation interference overlapping in frequency to its own primary downlink channel bandwidth if

- the intermodulation order is 2;
- the intermodulation order is 3 when both operating bands are between 450 MHz 960 MHz or between 1427 MHz 2690 MHz

In the case for EN-DC configurations in NR FR1 for which the intermodulation products caused by dual uplink operation do not interfere with its own primary downlink channel bandwidth as defined in Annex I the UE is mandated to operate in dual and triple uplink mode.

For EN-DC configurations in NR FR1 with uplink and downlink assigned to E-UTRA and NR FR1 bands given in Table 7.3B.2.3.5.1-1, Table 7.3B.2.3.5.1-1a, Table 7.3B.2.3.5.2-0 and Table 7.3B.2.3.5.2-1 the reference sensitivity is defined only for the specific uplink and downlink test points specified in Table 7.3B.2.3.5.1-1, Table 7.3B.2.3.5.1-1a, Table 7.3B.2.3.5.2-0 and Table 7.3B.2.3.5.2-1. For these test points the reference sensitivity levels specified in clause 7.3.1 in TS 36.101 [4] and 7.3.2 of TS 38.101-1 [2] for the corresponding channel bandwidths or in clause 7.3.1 of TS 36.101 [4] are relaxed by the amount of the parameter MSD given in Table 7.3B.2.3.5.1-1, Table 7.3B.2.3.5.1-1a, Table 7.3B.2.3.5.2-0 and Table 7.3B.2.3.5.2-1.

The throughput on each of the CGs shall be  $\geq$  95% of the maximum throughput of the respective reference measurement channels as specified in Annex A of TS 38.101-1 [2] and Annex A of TS 36.101 [4], with parameters specified in Table 7.3B.2.3.5.1-1, Table 7.3B.2.3.5.1-1a, Table 7.3B.2.3.5.2-0 and Table 7.3B.2.3.5.2-1 with dual UL transmissions overlapping in time unless otherwise stated.

#### 7.3B.2.3a Inter-band NE-DC within FR1

Reference sensitivity exceptions are specified for the condition when there is uplink transmission only in the aggressor band. This clause addresses directly only NE-DC configurations that don't have a corresponding specified EN-DC configuration or specific NE-DC exceptions.

## 7.3B.2.3a.1 Reference sensitivity exceptions due to UL harmonic interference for NE-DC in NR FR1

Sensitivity degradation is allowed for a band if it is impacted by UL harmonic interference from another band part of the same NE-DC configuration. For the NE-DC configurations that have an EN-DC defined configuration, the reference sensitivity exceptions for the victim band (high) are specified in Table 7.3B.2.3.1-1 with uplink configuration of the aggressor band (low) specified in Table 7.3B.2.3.1-2 are applicable.

### 7.3B.2.4 Inter-band EN-DC including FR2

7.3B.2.4.1 Void

### 7.3B.2.5 Inter-band EN-DC including both FR1 and FR2

# 7.3B.2.5.1 Reference sensitivity exceptions due to UL harmonic interference for EN-DC including both FR1 and FR2

For inter-band EN-DC of E-UTRA and NR in both FR1 and FR2, the UE is allowed to apply each sensitivity degradation for EN-DC in FR1 specified in clause 7.3B.2.3 TS 38.101-3 and for EN-DC including FR2 specified in clause 7.3B.2.3 of TS 38.101-3 independently.

## 7.3B.3 $\Delta R_{IB,c}$ , $\Delta R_{IBNC}$ for DC

#### 7.3B.3.0 General

For the UE which supports inter-band EN-DC or NE-DC configuration, the minimum requirement for reference sensitivity in Table 7.3.1-1 and Table 7.3.1-1a in TS 36.101 [4], clause 7.3.2, 7.3A.2, 7.3C.2 in TS 38.101-1 [2] and clause 7.3.2, 7.3A.2 in TS 38.101-2 [3] shall be increased by the amount given in  $\Delta R_{IB,c}$ ,  $\Delta R_{IBNC}$  in Tables below where unless otherwise stated, the same  $\Delta R_{IB,c}$ ,  $\Delta R_{IBNC}$  are applicable to NR band(s) part for DC configurations which have the same NR operating band combination. Unless otherwise stated,  $\Delta R_{IB,c}$  or  $\Delta R_{IBNC}$  is set to zero.

In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then

- When the operating band frequency range is  $\leq$  1 GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the average value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum  $\Delta R_{IB,c}$  among the different supported band combinations involving such band shall be applied
- When the operating band frequency range is > 1 GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the maximum value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3] for the applicable operating bands.

Unless  $\Delta R_{IB,c}$  is specified for the NE-DC configuration, the specified  $\Delta R_{IB,c}$  for the EN-DC configuration including same bands as the corresponding NE-DC configuration is applicable for the NE-DC configuration.

- 7.3B.3.1 Intra-band contiguous EN-DC
- 7.3B.3.2 Intra-band non-contiguous EN-DC

# Annex A (normative): Measurement channels

# A.1 General

The throughput values defined in the measurement channels specified in Annex A, are calculated and are valid per datastream (codeword). For multi-stream (more than one codeword) transmissions, the throughput referenced in the minimum requirements is the sum of throughputs of all datastreams (codewords).

The UE category entry in the definition of the reference measurement channel in Annex A is only informative and reveals the UE categories, which can support the corresponding measurement channel. Whether the measurement channel is used for testing a certain UE category or not is specified in the individual minimum requirements.

# A.2 UL reference measurement channels for E-UTRA TDD Config 2

# A.2.1 General

The measurement channels in the following clauses are defined to derive the requirements in clause 6 (Transmitter Characteristics) and clause 7 (Receiver Characteristics). The measurement channels represent example configurations of physical channels for different data rates.

# A.2.2 Reference measurement channels for E-UTRA

As per Table 4.2-1 in TS 36.211 [7] NOTE 1:

NOTE 2: NOTE 3:

### DL reference measurement channels for E-UTRA **A.3**

### A.3.1General

The number of available channel bits varies across the sub-frames due to PBCH and PSS/SSS overhead. The payload size per sub-frame is varied in order to keep the code rate constant throughout a frame.

Unless otherwise stated, no user data is scheduled on subframes #5 in order to facilitate the transmission of system information blocks (SIB).

The algorithm for determining the payload size A is as follows; given a desired coding rate R and radio block allocation

- 1. Calculate the number of channel bits N<sub>ch</sub> that can be transmitted during the first transmission of a given subframe.
- 2. Find A such that the resulting coding rate is as close to R as possible, that is,

$$\min R - (A + 24*(N_{CB} + 1))/N_{ch}, where N_{CB} = \begin{cases} 0, & \text{if } C = 1\\ C, & \text{if } C > 1 \end{cases}$$

subject to

- a) A is a valid TB size according to clause 7.1.7 of TS 36.213 [6] assuming an allocation of  $N_{RB}$  resource blocks.
- b) C is the number of Code Blocks calculated according to clause 5.1.2 of TS 36.212 [5].
- 3. If there is more than one *A* that minimizes the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93.
- 4. For TDD, the measurement channel is based on DL/UL configuration ratio of 3DL+DwPTS (10 OFDM symbol SSF7): 1UL

NOTE 2: For 1.4MHz, no data shall be scheduled on special subframes(1&6) to avoid problems with insufficient PDCCH performance.

NOTE 3: Reference signal, Synchronization signals and PBCH allocated as per TS 36.211 [7].

NOTE 4: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).

NOTE 5: As per Table 4.2-2 in TS 36.211 [7]. NOTE 6: As per Table 4.2-1 in TS 36.211 [7]

Annex H (normative): Modified MPR behavior	

The definitions of the bits in the modifiedMPRbehavior field have been moved to Annex H of 38.101-1[2].

# Annex I (normative): Dual uplink interferer

UE is mandated to support operation in dual and triple uplink mode for EN-DC configuration in NR FR1 listed in Table 5.5B.2-1, Table 5.5B.3-1, and Table 5.5B.4.1-1 and indicated by column single uplink allowed, Table 7.3B.2.3.5.1-1, Table 7.3B.2.3.5.2-0, Table 7.3B.2.3.5.2-1 or NE-DC configuration in NR FR1 listed in Table 5.5B.4a.1-1 and indicated by column single uplink allowed if the intermodulation products caused by the dual uplink operation do not interfere with its own primary downlink transmission channel bandwidth of PCell or PSCell. For intermodulation products falling into any secondary downlink channel bandwidth, UE single UL capability is not considered.

Formula for determining if the EN-DC in NR FR1 configuration with dual uplink operation interferes with its own downlink reception.

Interference bandwidth: IBW = |a| \* CBW1 + |b| \* CBW2

- |a| + |b| = 2 (or 3)
- CBW1 and CBW2 are the transmission bandwidth configurations of the UL channels

Center frequency of IBW: fIBW = |a \* f1 + b \* f2|

- f1 and f2 are center frequency of the transmission bandwidth configurations of each UL channel

The range of IMD 2 (or 3): [fIBW – IBW/2, fIBW + IBW/2]

- NOTE 1: UE shall be able to apply operations which are configured by RRC reconfiguration and corresponding HARQ timing on the transmission bandwidth.
- NOTE 2: For identified difficult band combination, during two adjacent RRC reconfiguration, the changing of transmission bandwidth should not introduce IM2 and IM3, which will result in UE changing from 2Tx to 1Tx. Otherwise, UE behavior is not specified.

For DC 3A n3A intra-band non-contiguous EN-DC combination, only single switched UL is supported in Rel-15.

For DC\_2A\_n2A, DC\_5A\_n5A, DC\_7A\_n7A, DC\_48A\_n48A, DC\_66A\_n66A intra-band non-contiguous EN-DC combination, and DC\_(n)5AA, DC\_(n)12AA, DC\_(n)38AA, DC\_(n)48AA intra-band contiguous EN-DC combination, only single switched UL is supported.
