## Intellectual Property Rights

#### **Essential patents**

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

#### **Trademarks**

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

# **Legal Notice**

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp.

## Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the <u>ETSI Drafting Rules</u> (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

#### **Foreword**

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

#### Introduction

The present document is part of a TS-family covering the 3rd Generation Partnership Project; Technical Specification Group Services and System Aspects; Telecommunication management, as identified below:

TS 32.421: "Subscriber and equipment trace; Trace concepts and requirements";

TS 32.422: "Subscriber and equipment trace; Trace control and configuration management";

TS 32.423: "Subscriber and equipment trace; Trace data definition and management";

Subscriber and MS Trace provide very detailed information at call level on one or more specific mobile(s). This data is an additional source of information to Performance Measurements and allows going further in monitoring and optimisation operations.

Contrary to Performance Measurements, which are a permanent source of information, Trace is activated on user demand for a limited period of time for specific analysis purpose

Trace plays a major role in activities such as determination of the root cause of a malfunctioning mobile, advanced troubleshooting, optimisation of resource usage and quality, RF coverage control and capacity improvement, dropped call analysis, Core Network and UTRAN end to end 3G procedure validation.

The capability to log data on any interface at call level for a specific user (e.g. IMSI) or mobile type (e.g. IMEI or IMEISV) allows getting information which cannot be deduced from Performance Measurements such as perception of end-user QoS during his call (e.g. requested QoS vs. provided QoS), correlation between protocol messages and RF measurements, or interoperability with specific mobile vendors.

Moreover, Performance Measurements provide values aggregated on an observation period, Subscriber and Equipment Trace give instantaneous values for a specific event (e.g. call, location update, etc.).

If Performance Measurements are mandatory for daily operations, future network planning and primary trouble shooting, Subscriber and MS Trace is the easy way to go deeper into investigation and 3G network optimisation.

In order to produce this data, Subscriber and MS trace are carried out in the NEs, which comprise the network. The data can then be transferred to an external system (e.g. an Operations System (OS) in TMN terminology, for further evaluation).

# 1 Scope

The present document describes Trace data definition and management. It covers the trace records content, their format and transfer across UMTS networks or EPS networks GSM Trace is outside of the scope of this specification..

The present document also describes the data definition for Minimization of Drive Tests (MDT) across UMTS networks or EPS networks.

The objectives of the present document are:

- To provide the descriptions for a standard set of Trace and MDT data;
- To define the common format of trace and MDT records; and
- To define a method for the reporting of Trace and MDT results across the management interfaces.

Clause 4 details the various Trace records content, Annex A provides Trace and MDT report file format, Annex B provides the trace report file conventions and transfer procedure, Annex C provides the trace reporting functional architecture and Annex D provides some trace and MDT files examples. Trace and MDT concepts and requirements are covered in TS 32.421 [2] while Trace control and configuration management are described in 3GPP TS 32.422 [3].

The definition of Trace and MDT data is intended to result in comparability of Trace and MDT data produced in a multi-vendor wireless UMTS and/or EPS network.

The following is beyond the scope of the present document, and therefore the present document does not describe:

- Any notification mechanisms or IRPs for trace. Only file transfer mechanism is specified for trace data transfer;
- Any data compression mechanisms for trace data transfer;
- Any Trace capability limitations (e.g. maximum number of simultaneous traced mobiles for a given NE).

#### 2 References

The following documents contain provisions, which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

# 3 Definitions, symbols and abbreviations

#### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TS 32.421 [2] and 3GPP TS 32.422 [3] apply.

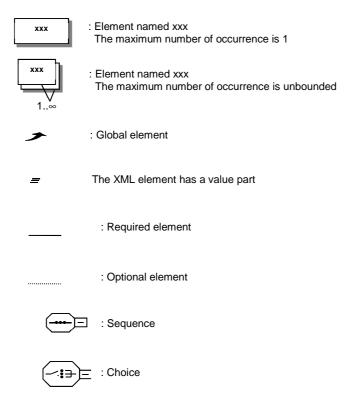

**Minimum Level of detail**: Allows for retrieval of a decoded subset of the IEs contained in the signalling interface messages.

**Medium Level of detail**: Allows for retrieval of the decoded subset of the IEs contained in the signalling interface messages in the Minimum Level plus a selected set of decoded radio measurement IEs.

**Maximum Level of detail**: Allows for retrieval of signalling interface messages within the Trace Scope in encoded format.

## 3.2 Symbols

For the purposes of the present document, the following symbols apply:

#### 3.3 Abbreviations

For the purposes of the present document, the abbreviations given in 3GPP TR 21.905 [4] and 3GPP TS 32.101 [1] apply.

#### 4 Trace Record Contents

#### 4.1 General

The trace reference, trace type and operation system identification are all provided on trace activation.

Each record may contain an MSC Server, MGW, SGSN, GGSN, S-CSCF, P-CSCF, UTRAN, HSS, MME, Serving GW, or E-UTRAN event record. A key is included in the table indicating whether or not the field is mandatory.

The following table shows the template for trace record description for minimum and medium trace depth:

| Interface name | terface name   Protocol name   IE name |           | Mossago namo(s)  | Trace | Notes |       |
|----------------|--|-----------|------------------|-------|-------|-------|
| interrace name | Protocol name                          | IE Hallie | wiessage name(s) | Min   | Med   | notes |
|                |  |           |                  |       |       |       |

**Interface name**: Contains the name of the interface, where the IE is available.

Protocol name: Contains the protocol name on the interface, where the IE is available.

**IE name**: The name of the Information Element, which should be decoded.

**Message name(s):** The name of the message(s), where the IE is included.

**Trace depth**: Shows in which trace depth the IE should be recorded. It also classifies whether the IE is mandatory in the trace record or not (M, O or X: meaning described in the previous table)

| M  | Mandatory             | This field must be in the trace record if it is available, i.e. if the message appears during the trace recording session and the IE is present in |
|----|-----------------------|--|
|    |                       | the message.   |
| 0  | Optional              | This field is optional and its support is a matter for agreement between equipment manufacturer and network operator.                              |
| X  | Not applicable        | This field is not required in this instance.   |
| CM | Conditional Mandatory | This field must be in the trace record if it is available and the condition is met.  |

NOTE: Any kind of comments related to the IE can be made here. Also this is the placeholder for referencing the relevant 3GPP specifications, which define the IE.

#### 4.2 MSC Server Trace Record Content

The following table shows the trace record content for MSC Server.

The trace record is the same for management based activation and for signalling based activation.

For MSC Server, the Minimum level of detail shall be supported.

| Interface name    | Prot. | IE name                      | Message name(s)   |     | depth | Notes                  |
|-------------------|-------|------------------------------|---|-----|-------|------------------------|
| interface fiallie | name  | IL Hame                      | • ,,  | Min | Med   | 110103                 |

#### 4.4 SGSN Trace Record Content

The following table shows the trace record content for SGSN.

The trace record is the same for management based activation and for signalling based activation.

For SGSN, the Minimum level of detail shall be supported.

| Interface nema | erface name Prot. IE name Message name(s) Trace depth |                                 | depth  | Notes |     |                        |

#### 4.5 GGSN Trace Record Content

The following table describes the trace record content for minimum and medium trace depth for GGSN. The record content is same for management based activation and for signalling based activation. For GGSN, the Minimum level of detail shall be supported.

| Interface name | Prot. Name  | IE name                       | MESSAGE NAME(S)  |     | depth | Notes     |
|----------------|-------------|-------------------------------|--|-----|-------|-----------|

#### **Definitions:**

• rncID of traced RNC: The id of the RNC traced, e.g. the RNC which handles the connection of the traced MS, during the Trace Recording Session.

• rncID of neighbouring RNC: The ids of all Neighbouring RNC involved in the Iur procedures during the Trace Recording Session.

• cId: The cIds of all cells involved in the Iub and Iur procedures during the Trace Recording Session. The cId is provided with each NBAP and

RNSAP messages

for which the cId is relevant.

• rabId: Specific recorded IE that contains the RAB identifier.

• rlld: Specific recorded IE that contains the Radio Link identifier

rbId: Specific recorded IE that contains the Radio Bearer identifier

Message name: Name of the protocol message

• Record extensions: A set of manufacturer specific extensions to the record

• Decoded: Some IEs shall be decoded (cf. detailed list in table 4.6.2. depending on trace depth)

• ASN.1: Messages in encoded format

Table 4.6.2: trace record description for minimum and medium trace depth

#### **Constraints:**

The following optional IE names shall be supported for corresponding modes as described below:

#### For FDD mode:

- Primary CPICH scrambling code of added cell
- Primary CPICH scrambling code of removed cell
- CPICH Ec/No
- CPICH RSCP
- UL Scrambling Code
- Minimum UL channelization length
- UARFCN downlink (Nd)
- UARFCN uplink (Nu)
- DL Scrambling Code
- DL Code information
- DL channelization code
- Received total wide band power

#### For TDD mode:

- PCCPCH RSCP
- Cell parameters Id
- UARFCN (Nt)
- Timeslot list
- UL Timeslot information
- DL Timeslot information
- UL Time Slot ISCP Info
- 4.7 Void
- 4.8 Void

38

## 4.9 HSS Trace Record Content

The following table contains the Trace record description for the minimum and medium trace depth for MAP and Diameter protocol for the C, D, Gr, Gc,Cx, Sh and S6a interfaces in the HSS.

The trace record is the same for management based activation and for signalling based activation.

| Interfect news | Prot. | IF w                                | Manage(-)  | Trace | Notes |                        |
|----------------|-------|-------------------------------------|--|-------|-------|------------------------|

# 4.10 BM-SC Trace Record Content

The following table describes the trace record content for minimum and medium trace depth for BM-SC.

The record content is same for management based activation and for signalling based activation.

For BM-SC, the Minimum level of detail shall be supported.

| Interface | Prot.        | IE name              | Massage name(s)   | Trace depth  |              | Notes        |             |   |   |   |           |
|-----------|--------------|----------------------|---|--------------|--------------|--------------|-------------|---|---|---|-----------|
| name      | name         | ie name              | Message name(s)   | Min          | Med          | Notes        |             |   |   |   |           |

## 4.11 PGW Trace Record Content

The following table shows the trace record content for PGW.

The trace record is the same for management based activation and for signalling based activation.

PGW shall support at least one of the following trace depth levels – Maximum, Medium or Minimum.

**Table 4.11.1: PGW Trace Record Content** 

| Interface (specific | Format   | Leve   | Level of details |        | Description  |
|---------------------|----------|--------|------------------|--------|--|
| messages)           | Format   | Min    | Med              | Max    | Description  |
|                     |          | М      | M                | 0      | Message name   |
|                     |          | 0      | 0                | 0      | Record extensions  |
| S2a/S2b             | Decoded  | M      | М                | X      | SGSNID of connected SGSN PGW ID of the traced PGW  |
|                     |          | M      | M                | Х      | Dedicated IE extracted from S2a/S2b messages between the traced PGW and the SGSN. A subset of IEs as given in the table 4.11.2. is provided. |
|                     | Encoded* | X      | Χ                | М      | Raw Messages: S2a/S2b messages between the traced PGW and the SGSN. The encoded content of the message is provided.                          |
|                     |          | M      | М                | 0      | Message name   |

## 4.12 MME Trace Record Content

The following table shows the trace record content for MME.

The trace record is the same for management based activation and for signalling based activation.

MME shall support at least one of the following trace depth levels – Maximum, Medium or Minimum.

**Table 4.12.1: MME Trace Record Content** 

| Interface (specific | F                                | Leve | el of de | tails | Provide the second seco |
|---------------------|----------------------------------|------|----------|-------|--|
| messages)           | Format                           | Min  | Med      | Max   | Description  |

| RRC (only dedicated           | Decoded | Х   | M        | Х     | Uu IEs from RRC measurement reports messages   |
| measurements)                 | ASN.1   | Х   | Х        | M     | RRC measurement reports messages   |

NOTE: For the security keys in IEs or part of IEs that are containing security keys used by the eNB (e.g. K<sub>eNB</sub>), the value 0 shall be written in the trace file.

#### **Definitions:**

Global eNBID of traced eNB: The id of the eNB traced, e.g. the eNB which handles the connection of the traced MS, during the Trace Recording Session. The id corresponds to the "Global eNB ID", as defined in [16] and [17].

Global eNBID of neighbouring eNB: The ids of all Neighbouring eNB involved in the X2 procedures during the Trace Recording Session. The id corresponds to the "Global eNB ID", as defined in [16] and [17].

cell Id: The cell Ids of the cells involved in the X2 procedures during the Trace Recording Session. The cell Ids is provided with each X2AP messages for which the cld is relevant.

E-RABId: Specific recorded IE that contains the E-RAB identifier.

Message name: Name of the protocol message

Record extensions: A set of manufacturer specific extensions to the record

Decoded: Some IEs shall be decoded (cf. detailed list in table 4.6.2. depending on trace depth)

ASN.1: Messages in encoded format

Table 4.13.2: trace record description for minimum and medium trace depth

#### **Constraints:**

The condition for capturing the following Information Element is that Cell Traffic Trace is used:

- Wait time from RRC protocol
- Establishment Cause from RRC protocol
- Selected PLMN-Identity from RRC protocol
- RegisteredMME from RRC protocol
- E-UTRAN CGI from S1 interface from the following messages: Initial UE message, Handover Notify

## 4.14 SGW Trace Record Content

The following table shows the trace record content for SGW.

The trace record is the same for management based activation and for signalling based activation.

SGW shall support at least one of the following trace depth levels – Maximum, Medium or Minimum.

**Table 4.14.1: SGW Trace Record Content** 

| Interface (specific | Format   | Level of details |     | tails | Description  |
|---------------------|----------|------------------|-----|-------|--|
| messages)           | Format   | Min              | Med | Max   | Description  |

### 4.17.2 Trace Record for UE location information

The following table contains the Trace record description for UMTS UE location information. The trace record is the same for management based activation and for signalling based activation.

| MDT measurement name | Measurement attribute name(s) | Measurement attribute definition   | Notes                  |  |
|----------------------|-------------------------------|--|------------------------|--|
| UE location          | GNSS pos                      | GNSS based coordinates, including (latitude, longitude) as reported by the UE. | TS 32.422<br>TS 37.320 |  |

# Annex A (normative): Trace Report File Format

#### A.0 Introduction

This annex describes the format of trace or MDT result files. Those files are to be transferred from the network (NEs or EM) to the NM.

The following conditions have been considered for the definition of this file format:

- The trace data volume and trace duration is not predictable. Depending on the data retrieval and storage mechanisms, several consecutive trace result files could be generated for a single traced call. The file naming convention shall allow rebuilding the temporal file sequences.
- Since the files are transferred via a machine-machine interface, the files should be machine-readable using standard tools.
- The file format should be independent from the data transfer protocol used to carry the file from one system to another.
- The file format should be generic across UMTS and EPS systems.
- The file format should be flexible enough to support further trace data types and decoded IEs, as well as vendor specific trace data.

## A.1 Parameter description and mapping table

The following table describes the XML trace file parameters.

Table: XML trace file parameters

| XML element / XML attribute specification | Description  |
|---|--|
| traceCollecFile                           | This is the top-level element. It identifies the file as a collection of trace or MDT data. This element   |
|   | includes: - a file header (element "fileHeader")   |
|   | - the collection of trace data items (elements "traceRecSession").   |
| fileHeader                                | This is the trace file header element. This element includes:  |
| !   | <ul> <li>a version indicator (attribute specification "fileFormatVersion")</li> <li>the PLMN for the Participating Operator on who's behalf the Trace Session was performed</li> </ul> |
| !   | (element "pOPLMN")   |
| !   | - the vendor name of the sending network node (attribute specification "vendorName")   |
| !   | - the name of the sending network node (attribute specification "fileSender elementDn")  |
|   | <ul> <li>the type of the sending network node (attribute specification "fileSender elementType")</li> <li>a time stamp (attribute specification "traceCollec beginTime").</li> </ul>   |
| fileHeader                                | This attribute specification identifies the file format version applied by the sender. The format version  |
| fileFormatVersion                         | defined in the present document shall be the abridged number and version of this 3GPP document   |
|   | (see below). The abridged number and version of a 3GPP document is constructed from its version specific full  |
| !   | reference "3GPP [] (yyyy-mm)" by:  |
| !   | - removing the leading "3GPP TS"   |
| !   | <ul> <li>removing everything including and after the version third digit, representing editorial only<br/>changes, together with its preceding dot character</li> </ul>                |
| !   | - from the resulting string, removing leading and trailing white space, replacing every multi  |
| !   | character white space by a single space character and changing the case of all characters  |
| fileHeader pOPLMN                         | to uppercase.  Optional element identifies the PLMN for the Participating Operator. This parameter can be used   |
| TITCHEGGET POTEM                          | when the node that is recording the data is shared between operators.  |
| fileHeader vendorName                     | Optional attribute specification that has the following value part: vendor of the equipment that   |
| fileSender elementDn                      | provided the trace file.  Optional attribute specification that uniquely identifies the NE or EM that assembled this trace file,   |
|   | according to the definitions in 3GPP TS 32.300 [11].   |
| fileSender elementType                    | Optional attribute specification that identifies type of the network node that generated the file. For MDT case, this attribute only has the type of "RNC" or ""eNodeB".               |
| traceCollec beginTime                     | This attribute specification contains a timestamp that refers to the start of the first trace data that is   |
|   | stored in this file. It is a complete timestamp including day, time and delta UTC hour. E.g. "2001-  |
| traceRecSession                           | 09-11T09:30:47-05:00".  Optional element that contains the traced data associated to a Trace Recording Session. It includes:   |
| Clacerecsession                           | - the DN prefix (attribute specification "dnPrefix")   |
| !   | - the trace session identifier (element specification "traceSessionRef")   |
| !   | - the trace recording session identifier (attribute specification "traceRecSessionRef")  |
| !   | - the start time of the call (attribute specification "stime") - the ue identifier (element "ue")  |
|   | - the traced messages (elements "msg") for trace or the UE measurements (elements "meas")  |
|   | for MDT  |
| traceRecSession<br>dnPrefix               | Optional attribute specification that provides the DN prefix (see 3GPP TS 32.300 [11]).  |
| traceSessionRef                           | This element provides a unique trace session identifier as described in 3GPP TS 32.421 [2]. Trace  |
|   | Reference is composed of MCC digits, MNC digits, and Trace ID where:   |
|   | - MCC is in BCD format, 3 digits in length (element specification "MCC")   |
|   | - MNC is in BCD format, 1 to 3 digits in length, with no filler digit for MNCs less than 3 digits  |
|   | (element specification "MNC")  |
|   | Trace ID is in hexadecimal format, 6 digits in length, hex letters (A through F) are   |
|   | capitalized(element specification "TRACE_ID").   |
| traceRecSession                           | Attribute specification that provides a unique trace recording session identifier as described in  |
| traceRecSessionRef                        | 3GPP TS 32.421 [2] and 3GPP TS 32.422 [3]. Trace Recording Session Reference is represented  |
|   | in hexadecimal format. No filler digits for hex numbers of less than four digits. All hex letters (A thru F) are capitalized.  |
| traceRecSession stime                     | Optional attribute specification that provides the start time of the call.   |
| ue  | This element gives the ue identifier provided in trace activation messages. It includes:   |
|   |  |
|   | <ul> <li>the ue identifier type (attribute specification "idType")</li> <li>the ue identifier value (attribute specification "idValue")</li> </ul>                                     |

| XML element / XML attribute specification | Description   |
|---|---|
| ue idType                                 | Attribute specification that provides the ue identifier type (IMSI, IMEI (SV), TAC, or Public User  |
| ue idValue                                | Identity). For management based MDT, IMSI or IMEI(SV) can not be selected as ue idType.  Attribute specification that provides the ue identifier value, represented in decimal. This attribute is optional for management based MDT.  |
| msg                                       | This element contains the information associated to a traced message. This element will not be included if the file is from the MME for retrieving the IMSI/IMEI (SV) information. It includes:  - the function name associated to the traced message (attribute specification "function")  - the time difference with attribute specification "traceCollec beginTime" (attribute |
|   | <ul> <li>specification "changeTime")</li> <li>a boolean value that indicates if the message is vendor specific (attribute specification</li> </ul>  |
|   | "vendorSpecific") - the protocol message name (attribute specification "name")  |
|   | - the NE initiator of the protocol message (element "initiator")  |
|   | <ul> <li>the NE target(s) of the protocol message (element "target")</li> <li>the encoded protocol message (element "rawMsg")</li> </ul>  |
|   | - the traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order   |
| msg function                              | This element is trace specific and not used for MDT.  Attribute specification that provides the function name associated to the traced message (e.g. luu, lu  |
| msg runccion                              | CS, lub, Intra frequency measurement, Gb,). This attribute is trace specific and not used for MDT.  |
| msg changeTime                            | Attribute specification that provides the time difference with attribute specification "traceCollec   |
|   | beginTime". It is expressed in number of seconds and milliseconds (nbsec.ms). This attribute is trace specific and not used for MDT.  |
| msg vendorSpecific                        | Attribute specification whose value part is a boolean value that indicates if the message is vendor   |
| msg name                                  | specific (true) or not (false). This attribute is trace specific and not used for MDT.  Attribute specification that provides the protocol message name. This attribute is trace specific and   |
|   | not used for MDT.   |
| initiator                                 | Optional element that identifies the NE initiator of the protocol message. Each includes:  - the type of the network node that initiate the message (attribute specification "type")  |
|   | - the LDN of NE initiator of the protocol message (element's content). The element's content  |
|   | may be empty in case the initiator is the sender or the mobile  |
| initiator type                            | This element is trace specific and not used for MDT.  Optional attribute specification that provides the type of the network node that initiate the message,  |
|   | e.g. "RNC", "SGSN". This element is trace specific and not used for MDT.  |
| target                                    | Optional element that identifies the NE target(s) of the protocol message. It includes:  - the type of the network node that receive the message (attribute specification "type")   |
|   | - the LDN or IP Address of NE target of the protocol message (element's content). The   |
|   | element's content may be empty in case the target is the sender or the mobile  This element is trace specific and not used for MDT.   |
| target type                               | Optional attribute specification that provides the type of the network node that receive the message,   |
| NumOfTargets                              | e.g. "RNC", "SGSN". This element is trace specific and not used for MDT.  Optional attribute specification that provides the number of targets that the message is sent to. This  |
| Numorrargets                              | is populated <b>ONLY</b> if the Target is not explicitly specified and is useful when there are a large number of targets that the message is sent to. This attribute is trace specific and not used for MDT.   |
| rawMsg                                    | Optional element that contains the encoded protocol message. It includes:   |
|   | <ul> <li>the protocol name associated to the event (attribute specification "protocol")</li> <li>the protocol version (attribute specification "version")</li> </ul>  |
|   | - the hexadecimal encoded form of the message (element's content)   |
|   | This element is available only if the trace depth is maximum.  This attribute is trace specific and not used for MDT.   |
| rawMsg protocol                           | Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). This  |
| rawMsg version                            | attribute is trace specific and not used for MDT.  Attribute specification that provides the protocol version. This attribute is trace specific and not used  |
|   | for MDT.  |
| ieGroup                                   | Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes:   |
|   | - the IE group name (attribute specification "name")  |
|   | - the IE group value (attribute specification "value")  |
|   | <ul> <li>zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in<br/>any order</li> </ul>  |
|   | This element is available only if the trace depth is medium or minimum.   |
| ieGroup name                              | This attribute is trace specific and not used for MDT.  Optional attribute specification that provides the IE group name (e.g. "RAB parameters").   |
| ieGroup value                             | Optional attribute specification that provides the IE group value when it exists (e.g. "RAB   |
| ie  | identifier"). This attribute is trace specific and not used for MDT.  Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It   |
| 16  | optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes:   |
|   | - the IE name (attribute specification "name")  |
|   | <ul> <li>the IE value (element's content)</li> <li>This element is available only if the trace depth is medium or minimum.</li> </ul>   |
| 4   | This attribute is trace specific and not used for MDT.  |
| ie name                                   | Attribute specification that provides the IE name (e.g. "Minimum DL Power"). This attribute is trace specific and not used for MDT.   |
|   | 1 -L  |

| XML element / XML attribute specification | Description  |
|---|--|
| meas                                      | This element contains the information associated to a UE measurement in MDT task. It includes:   |
|   | - the measurement name (attribute specification "meas name") - the measurement value (element's content)   |
|   | This element is MDT specific and not used for trace.   |
| meas name                                 | Attribute specification that provides the IE name. The IEs are specified in the Trace Record for Immediate MDT measurements table. This attribute is MDT specific and not used for trace.  |
| meas changeTime                           | Attribute specification that provides the time difference with attribute specification "traceCollec beginTime". It is expressed in number of seconds and milliseconds (nbsec.ms). This attribute is MDT specific and not used for trace.                 |
| meas vendorSpecific                       | Attribute specification whose value part is a boolean value that indicates if the measurement is vendor specific (true) or not (false). The vendor specific measurements are taken at eNB or RNC. This attribute is MDT specific and not used for trace. |
| target cell                               | Attribute identifies the serving cell that the UE measurement is taken. This attribute is MDT specific and not used for trace.   |
| UE location                               | Optional attribute that identifies the UE location information when the measurement is taken. The IEs are specified in the Trace Record for UE location information table. This attribute is MDT specific and not used for trace.                        |

### A.2 XML file format definition

For encoding of the information content, XML (see Extensible Markup Language (XML) 1.0, W3C Recommendation [5], [6], [7], [8] and [9]) will be used. The XML schema contains the mark-up declarations that provide a grammar for the trace file format. The XML schema is defined below.

#### A.2.1 XML trace/MDT file diagram

The following figure A.2.1-1 describes the XML element structure of a trace/MDT XML file.

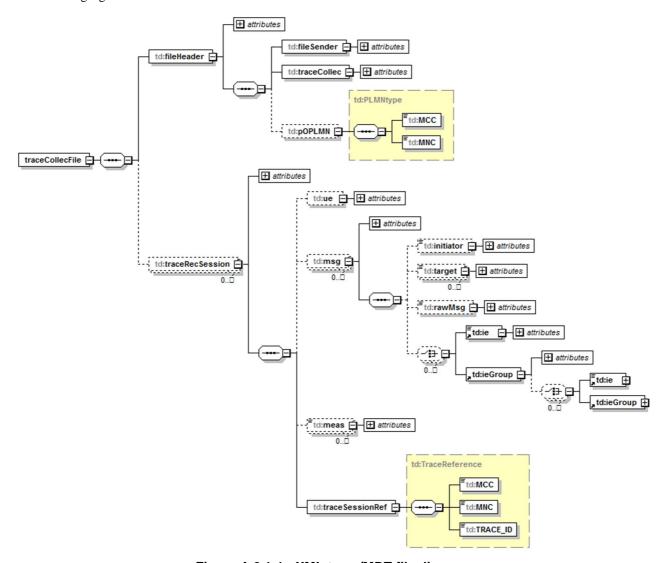

Figure A.2.1-1: XML trace/MDT file diagram

NOTE: In case a trace only recording session, the elements/attributes (such as "meas") which are specific to MDT but not used for trace should be excluded from the file; In case a MDT only recording session, the elements/attributes (such as "msg") which are specific to trace but not used for MDT should be excluded from the file: In case of a combined trace and MDT recording session, all the elements/attributes are included in the file.

#### A.2.2 Trace data file XML schema

The following XML schema traceData.xsd is the schema for trace or MDT data XML files:

```
<?xml version="1.0" encoding="UTF-8"?>
 3GPP TS 32.423 Subscriber and Equipment Trace or MDT data definition and management
 Trace data file XML schema
 traceData.xsd
<schema
 targetNamespace=
"http://www.3gpp.org/ftp/specs/archive/32_series/32.423#traceData"
 elementFormDefault="qualified"
 xmlns="http://www.w3.org/2001/XMLSchema"
 xmlns:td=
"http://www.3gpp.org/ftp/specs/archive/32_series/32.423#traceData"
<!-- XML types specific for Trace data file -->

## Annex B (normative): Trace Report File Conventions and Transfer Procedure

#### B.0 Introduction

This annex describes naming conventions of files containing trace results and the procedure to transfer these files from the network to the NM.

## B.1 File naming convention

The following convention shall be applied for trace result file naming:

<Type><Startdate>.<Starttime>-<SenderType>.<SenderName>.[<TraceReference>].[<TraceRecordingSessionRef>]

- 1) The Type field indicates if the file contains trace data for single or multiple calls, where:
  - "A" means single Trace Recording Session, single sender NE;
  - "B" means multiple Trace Recording Sessions, single sender NE;
  - "C" means IMSI/IMEI (SV) information for cell traffic trace or IMEI-TAC if area based MDT trace is involved (3GPP TS 32.422 [3] clause 4.4).
- 2) The Startdate field indicates the date of the first record in the trace file. The Startdate field is of the form YYYYMMDD, where:
  - YYYY is the year in four-digit notation;
  - MM is the month in two digit notation (01 12);
  - DD is the day in two digit notation (01 31).
- 3) The Starttime field indicates the time of the first record in the trace file. The Starttime field is of the form HHMMSSshhmm, where:
  - HH is the two digit hour of the day (local time), based on 24 hour clock (00 23);
  - MM is the two digit minute of the hour (local time) (00-59);
  - SS is the two digit second of the minute (local time) (00-59);
  - s is the sign of the local time differential from UTC (+ or -), in case the time differential to UTC is 0 then the sign may be arbitrarily set to "+" or "-";
  - hh is the two digit number of hours of the local time differential from UTC (00-23);
  - mm is the two digit number of minutes of the local time differential from UTC (00-59).
- 4) SenderType field is the type of NE defined by IOC attribute managedElementType in 3GPP TS 32.622 [12] that recorded and sent the trace file; SenderName field is the identifier of the NE that recorded and sent the trace file.
- 5) TraceRecordingSessionReference field is set only if the type field is A, and is represented in hexa-decimal format. TraceRecordingSessionReference is a 4 digit hexadecimal number and will not include filler digits for values less than 4 digits in length. All hexadecimal letters (A thru F) are capitalized.
- 6) TraceReference field is set if the type field is A. For type B the Trace Reference is optional and will be used when one trace file is created per trace session with multiple trace recording session. Trace Reference is represented in hexadecimal format. Trace Reference as defined in 3GPP TS 32.422 [3] is composed of PLMN ID (MCC, MNC) and Trace ID. The PLMN identity consists of 3 digits for MCC followed by either a filler digit plus 2 digits from MNC (in case of 2 digit MNC) or 3 digits from MNC (in case of a 3 digit MNC). MCC and MNC are in BCD format.

```
Example: If MCC: 405, MNC: 139
octet 1: 0x04 (MCC digit 2, MCC digit 1)
octet 2: 0x15 (MNC digit 1, MCC digit 3)
```

```
octet 3: 0x93 (MNC digit 3, MNC digit 2)
```

Also if the MNC is 2 digits (MCC: 405 and MNC 39)

octet 1: 0x04 (MCC digit 2, MCC digit 1)

octet 2: 0xF5 (MNC digit 1, MCC digit 3)

octet 3: 0x93 (MNC digit 3, MNC digit 2)

7) Trace Reference is set if the type field is C.

See bullet 6 above for details regarding the representation of the Trace Reference. Some examples describing file naming convention:

1) file name: A20090928.231500+0200-MME.MME5. 13F23200056.125,

meaning: file produced by MME< MME5> on September 28, 2009, first trace record at 23:15:00 local time with a time differential of +2 hours against UTC. The file contains trace data for the Trace Session with the Trace reference 13F232000056 (where MCC is 312, MNC is 23, and Trace ID is 000056, all in hexadecimal format) and for the Trace Recording Session with the reference 125.

2) file name: B20030115.170000-0300-RNC.RNC02,

meaning: file produced by RNC<RNC02> on January 15, 2003, first trace record at 17:00:00 local time with a time differential of -3 hours against UTC. The file contains trace data for several Trace Recording Sessions.

3) file name: B20030115.170000-0300-RNC.RNC02. 4358070034D7,

meaning: file produced by RNC<RNC02> on January 15, 2003, first trace record at 17:00:00 local time with a time differential of -3 hours against UTC. The file contains trace 4358070034D7 (where MCC is 348, MNC is 570, and Trace ID is 0034D7) data for Trace reference and several Trace Recording Sessions.

4) file name C20030115.170000-0300-MME.MME02. 26F452550021

Meaning: file produced by MME<MME02> on January 15, 2003, first trace record at 17:00:00 local time with a time differential of -3 hours against UTC. The file contains IMSI/IMEI (SV) or IMEI-TAC information for one or more UEs traced at eNB with Trace Reference26F452550021 (where MCC is 624, MNC is 25, and Trace ID is 550021).

### B.2 File transfer

- Data retrieval and storage mechanisms are vendor specific.
- There is no constraint on data retrieval periodicity.

## Annex C (informative):

## Trace Functional Architecture: Reporting

## C.1 Figure of Trace Reporting

The following represents the trace reporting procedures.

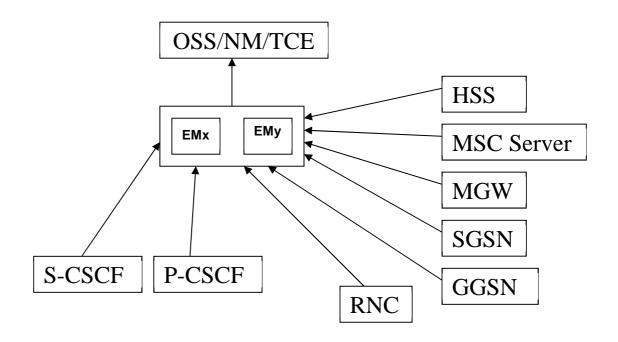

Figure C.1.1: Trace Reporting in System context A

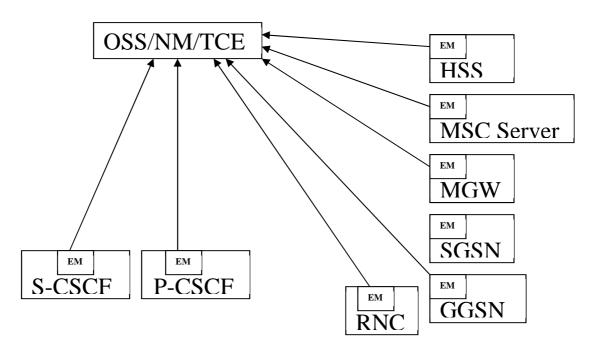

Figure C.1.2: Trace Reporting in System Context B

# Annex D (informative): Examples of trace files

## D.1 Examples of trace XML file

#### D.1.1 Example of XML trace file with the maximum level of details
