#### Foreword

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

#### where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

### 1 Scope

The present document contains an electronic copy of the ANSI-C code for the Floating-point Enhanced aacPlus codec [1].

#### 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 4 Floating point ANSI-C code structure

This clause gives an overview of the structure of the floating point ANSI-C code and provides an overview of the contents and organization of the C code attached to the present document.

The C code has been verified on the following systems:

- IBM PC/AT compatible computers with Windows XP, 2000 and Microsoft Visual C++ v.6.0 compiler.
- IBM PC/AT compatible computers with Linux OS and GCC v.3.3 compiler.

ANSI-C was selected as the programming language because portability was desirable.

#### 4.1 Contents of the floating point ANSI-C source code

The C code distribution is organised in two directories for encoder and decoder and further into several subdirectories, reflecting the major building blocks of the Enhanced aacPlus codec. The file descriptions on root level as well as the directory structure is given as follows:

Table 1: Source code directory structure for the encoder (FloatFR\_aacPlusenc)

Directory	Description
README.txt	information on how to compile
Makefile	UNIX style encoder Makefile
FloatFR_aacPlusEnc.dsw	Win32 MSVC 6.0 encoder workspace
FloatFR_aacPlusEnc.dsp	Win32 MSVC 6.0 encoder makefile
src/	directory for the encoder frontend
	·
FloatFR_fastaacenc/	AAC encoder library
FloatFR_resamplib/	resampler library
FloatFR_sbrenclib/	SBR encoder library

Table 2: Source code directory structure for the decoder (FloatFR\_aacPlusdec)

Directory	Description
README.txt	information on how to compile
Makefile	UNIX style encoder Makefile
FloatFR_aacPlusdec_mp eg4.dsw	Win32 MSVC 6.0 decoder workspace
FloatFR_aacPlusdec_mp eg4.dsp	Win32 MSVC 6.0 decodec makefile
src/	directory for the decoder frontend
FloatFR_aacdec	AAC decoder library
FloatFR_sbrdeclib/	SBR decoder library

Table 3: Source code directory structure common for encoder and decoder

Directory	Description		
FloatFR_bitbuflib/	bitstream reading/writing library		
FloatFRlib/	general purpose functionalities		
lib/	precompiled libraries for audio and bitstream file format handling		

The distributed files with suffix "c" contain the source code and the files with suffix "h" are the header files. Within the respective libraries, the RAM data is contained in "xxx\_ram" files with suffix "c", the ROM data is contained in "xxx\_rom" files with suffix "c". Makefiles are provided for the platforms in which the C code has been verified (listed above).

Note that the FloatFRlib/, FloatFR\_bitbuflib/ and lib/ directory are identical for encoder and decoder. A list of source code files with the respective lines of code (pure C instructions) is given below:

## 4.2 Program execution

The Enhanced aacPlus codec is implemented in two programs:

- enhAacPlusEnc.exe
- enhAacPlusDec.exe

The programs should be called like:

- enhAacPlusEnc.exe <wav\_file> <bitstream\_file> <bitrate> <(m)ono/(s)tereo>
- enhAacPlusDec.exe <br/>
  <br/>bitstream\_file> <wav\_file> <mode> [error\_pattern\_file]

The audio files contain 16-bit linear encoded PCM samples with wav header, the bitstream files are of 3GPP type an the error patter file is a ASCII file, see section 5.

The encoder and decoder command line handling is also explained by running the applications without input arguments.

## 4.3 Memory requirements

The data types of variables and tables used in the floating-point implementation are plain ANSI-C data types, the following types are used:

- char
- unsigned char
- short
- int
- unsigned int
- float

#### 4.3.1 Constants and tables

This clause contains a listing of all constants and tables contributing to the ROM requirements of the encoder and decoder.

#### 5 File formats

This clause describes the file formats used by the encoder and decoder programs.

#### 5.1 Audio input file (encoder input/decoder output)

The audio input files read by the encoder and written by the decoder are 16-bit PCM wave files. For convenient handling of wave files a precompiled audio-fileformat library is used.

#### 5.2 Bitstream file format (encoder output/decoder input)

The encoder program writes and the decoder program reads raw frames packetized in access units as described by 3GPP TS 26.244. For packetization the ISO media library is used. A precompiled library is used.

#### 5.3 Error pattern file (decoder input)

The decoder program can optionally process an additional input file which describes an error pattern. The format of the error pattern file is 1 character per line. Each line corresponds to one frame, where a '0' indicates that the respective frame has been transmitted without errors, while a '1' indicates that the corresponding frame has been lost and error concealment shall be applied by the decoder.

# Annex A (informative): Weighted MOPS and PROM

The complexity numbers for the Enhanced aacPlus audio codec can be found in the following table, the numbers have been derived using the 'allcat.wav' item, which holds all the material from the selection test concatenated in one single item. For every test case the average and worst frame weighted MOPS figure has been derived. The worst case wMOPS figure over all test cases has been marked in **blue**.
