DECTTM, **PLUGTESTS**TM and **UMTS**TM are Trade Marks of ETSI registered for the benefit of its Members. **TIPHON**TM and the **TIPHON logo** are Trade Marks currently being registered by ETSI for the benefit of its Members. **3GPP**TM is a Trade Mark of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners.

Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

The present document is part of a TS-family covering the 3rd Generation Partnership Project; Technical Specification Group Services and System Aspects; Telecommunication management, as identified below:

- TS 32.421: "Subscriber and equipment trace; Trace concepts and requirements";
- TS 32.422: "Subscriber and equipment trace; Trace control and configuration management";
- TS 32.423: "Subscriber and equipment trace; Trace data definition and management";

Subscriber and MS Trace provide very detailed information at call level on one or more specific mobile(s). This data is an additional source of information to Performance Measurements and allows going further in monitoring and optimisation operations.

Contrary to Performance Measurements, which are a permanent source of information, Trace is activated on user demand for a limited period of time for specific analysis purpose

Trace plays a major role in activities such as determination of the root cause of a malfunctioning mobile, advanced troubleshooting, optimisation of resource usage and quality, RF coverage control and capacity improvement, dropped call analysis, Core Network and UTRAN end to end 3G procedure validation.

The capability to log data on any interface at call level for a specific user (e.g. IMSI) or mobile type (e.g. IMEI or IMEISV) allows getting information which cannot be deduced from Performance Measurements such as perception of end-user QoS during his call (e.g. requested QoS vs. provided QoS), correlation between protocol messages and RF measurements, or interoperability with specific mobile vendors.

Moreover, Performance Measurements provide values aggregated on an observation period, Subscriber and Equipment Trace give instantaneous values for a specific event (e.g. call, location update, etc.).

If Performance Measurements are mandatory for daily operations, future network planning and primary trouble shooting, Subscriber and MS Trace is the easy way to go deeper into investigation and 3G network optimisation.

In order to produce this data, Subscriber and MS trace are carried out in the NEs, which comprise the network. The data can then be transferred to an external system (e.g. an Operations System (OS) in TMN terminology, for further evaluation).

1 Scope

The present document describes Trace data definition and management. It covers the trace records content, their format and transfer.

The objectives of the present document are:

- To provide the descriptions for a standard set of Trace data;
- To define the common format of trace records; and
- To define a method for Trace results reporting across the management interfaces.

Clause 4 details the various Trace records content, Annex A provides Trace report file format, Annex B provides the trace report file conventions and transfer procedure, Annex C provides the trace reporting functional architecture and Annex D provides some trace files examples. Trace concepts and requirements are covered in TS 32.421 [2] while Trace control and configuration management are described in 3GPP TS 32.422 [3].

The definition of Trace data is intended to result in comparability of Trace data produced in a multi-vendor wireless 3G network.

The following is beyond the scope of the present document, and therefore the present document does not describe:

- Any notification mechanisms or IRPs for trace. Only file transfer mechanism is specified for trace data transfer;
- Any data compression mechanisms for trace data transfer;
- Any Trace capability limitations (e.g. maximum number of simultaneous traced mobiles for a given NE).

2 References

The following documents contain provisions, which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TS 32.421 [2] and 3GPP TS 32.422 [3] apply.

Minimum Level of detail: Allows for retrieval of a decoded subset of the IEs contained in the signalling interface messages.

Medium Level of detail: Allows for retrieval of the decoded subset of the IEs contained in the signalling interface messages in the Minimum Level plus a selected set of decoded radio measurement IEs.

Maximum Level of detail: Allows for retrieval of signalling interface messages within the Trace Scope in encoded format.

3.2 Symbols

For the purposes of the present document, the following symbols apply:

3.3 Abbreviations

For the purposes of the present document, the abbreviations given in 3GPP TR 21.905 [4] and 3GPP TS 32.101 [1] apply.

4 Trace Record Contents

4.1 General

The trace reference, trace type and operation system identification are all provided on trace activation. Each record may contain an MSC Server, MGW, SGSN, GGSN, S-CSCF, P-CSCF, UTRAN, or HSS event record. A key is included in the table indicating whether or not the field is mandatory.

The following table shows the template for trace record description for minimum and medium trace depth:

Interface	Prot.	IE name	Message name(s)	Trace	Notes	
name	name	IL Hallie		Min	Med	Mores

Interface name: Contains the name of the interface, where the IE is available.

Protocol name: Contains the protocol name on the interface, where the IE is available.

IE name: The name of the Information Element, which should be decoded.

Message name(s): The name of the message(s), where the IE is included.

Trace depth: Shows in which trace depth the IE should be recorded. It also classifies whether the IE is mandatory in the trace record or not (M, O or X: meaning described in the previous table)

M	Mandatory	This field must be in the trace record if it is available, i.e. if the message appears during the				
		trace recording session and the IE is present in the message.				
0	Optional	This field is optional and its support is a matter for agreement between equipment manufacturer				
		and network operator.				
X	Not applicable	This field is not required in this instance.				

NOTE: Any kind of comments related to the IE can be made here. Also this is the placeholder for referencing the relevant 3GPP specifications, which define the IE.

4.2 MSC Server Trace Record Content

The following table shows the trace record content for MSC Server. The trace record is the same for management based activation and for signalling based activation.

For MSC Server, the Minimum level of detail shall be supported.

4.4 SGSN Trace Record Content

The following table shows the trace record content for SGSN. The trace record is the same for management based activation and for signalling based activation.

For SGSN, the Minimum level of detail shall be supported.

Interface name	Prot.	IE name	Message name(s)	Trace	depth Med	Notes

4.6 UTRAN Trace Record Content

For RNC, the Maximum level of detail shall be supported.

Table 4.6.1: UTRAN Trace Record Content

Interface (specific	Format	Level of details			Description		
messages)		Minimum	Medium	Maximum			
		M	M	0	Message name		
	Decoded	0	0	0	Record extensions		
RRC (without rrc dedicated	Decoded	M	М	Х	rncID of traced RNC		
measurements)		М	М	Х	Dedicated IE extracted from RRC messages between the traced RNC and the UE. A subset of IEs as given in the table 4.6.2. is provided.		
	ASN.1	Х	Х	М	Raw Uu Messages: RRC messages between the traced RNC and the UE. The encoded content of the message is provided		
		М	М	0	Message name		
		0	0	0	Record extensions		
lub (without nbap dedicated	Decoded	М	М	Х	rncID of traced RNC cld		
measurements)		М	М	Х	rbId + Dedicated IE extracted from NBAP messages send/received inside traced UEs communication context. A subset of IEs as given in the table 4.6.2.is provided		
	ASN.1	Х	Х	М	Raw lub Messages: NBAP messages between the traced RNC and the NodeB or cell. The encoded content of the message is provided		
		М	М	0	Message name		
	Decoded	0	0	0	Record extensions		
lu		М	М	Х	rncID of traced RNC CoreNetworkID CN Domain Indicator		
		М	М	Х	rabld + Dedicated IE extracted from RANAP messages between the traced RNC and Core Network. A subset of IEs as given in the table 4.6.2. is provided.		
	ASN.1	Х	Х	М	Raw Iu Messages RANAP: messages between the traced RNC and Core Network The encoded content of the message is provided		
		M	М	0	Message name		
		0	0	0	Record extensions		
lur	Decoded	М	М	Х	rncID of traced RNC rncID of neighbouring RNC		
		М	М	х	rlld + Dedicated IE extracted from RNSAP messages between the traced RNC and the neighbouring RNC. A subset of IEs as given in the table 4.6.2.is provided		
	ASN.1	Х	Х	М	Raw lur Messages: RNSAP messages between the traced RNC and the neighbouring RNC. The encoded content of the message is provided		
nbap (only dedicated	Decoded	Х	М	Х	lub IEs from NBAP measurement reports messages		
measurements)	ASN.1	Х	Х	М	NBAP measurement reports messages		
rrc (only dedicated	Decoded	Х	М	Х	Uu IEs from RRC measurement reports messages		
measurements)	ASN.1	Х	Х	М	RRC measurement reports messages		

Definitions:

- <u>rncID of traced RNC</u>: The id of the RNC traced, e.g. the RNC which handles the connection of the traced MS, during the Trace Recording Session.
- <u>rncID of neighbouring RNC</u>: The ids of all Neighboring RNC involved in the Iur procedures during the Trace Recording Session.
- <u>cId</u>: The cIds of all cells involved in the Iub and Iur procedures during the Trace Recording Session. The cId is provided with each NBAP and RNSAP messages for which the cId is relevant.
- <u>rabId</u>: Specific recorded IE that contains the RAB identifier.
- <u>rlId</u>: Specific recorded IE that contains the Radio Link identifier
- rbId: Specific recorded IE that contains the Radio Bearer identifier
- Message name: Name of the protocol message
- Record extensions: A set of manufacturer specific extensions to the record
- <u>Decoded</u>: Some IEs shall be decoded (cf. detailed list in table 4.6.2. depending on trace depth)
- ASN.1: Messages in encoded format

Annex A (normative): Trace Report File Format

This annex describes the format of trace result files. Those files are to be transferred from the network (NEs or EM) to the NM.

The following conditions have been considered for the definition of this file format:

- The trace data volume and trace duration is not predictable. Depending on the data retrieval and storage mechanisms, several consecutive trace result files could be generated for a single traced call. The file naming convention shall allow rebuilding the temporal file sequences.
- Since the files are transferred via a machine-machine interface, the files should be machine-readable using standard tools.
- The file format should be independent from the data transfer protocol used to carry the file from one system to another.
- The file format should be generic across 3G systems.
- The file format should be flexible enough to support further trace data types and decoded IEs, as well as vendor specific trace data.

A.1 Parameter description and mapping table

The following table describes the XML trace file parameters.

Table: XML trace file parameters

XML element / XML attribute specification	Description
traceCollecFile	This is the top-level element. It identifies the file as a collection of trace data. This element includes:
	- a file header (element "fileHeader")
	- the collection of trace data items (elements "traceRecSession").
fileHeader	This is the trace file header element. This element includes:
	- a version indicator (attribute specification "fileFormatVersion")
	- the vendor name of the sending network node (attribute specification "vendorName")
	- the name of the sending network node (attribute specification "fileSender elementDn")
	 the type of the sending network node (attribute specification "fileSender elementType")
	- a time stamp (attribute specification "traceCollec beginTime").
fileHeader	This attribute specification identifies the file format version applied by the sender. The format version
fileFormatVersion	defined in the present document shall be the abridged number and version of this 3GPP document
	(see below).
	The abridged number and version of a 3GPP document is constructed from its version specific full
	reference "3GPP [] (yyyy-mm)" by:
	- removing the leading "3GPP TS"
	- removing everything including and after the version third digit, representing editorial only
	changes, together with its preceding dot character from the resulting string, removing leading and trailing white space, replacing every multi
	character white space by a single space character and changing the case of all characters to
	uppercase.
fileHeader vendorName	Optional attribute specification that has the following value part: vendor of the equipment that
	provided the trace file.
fileSender elementDn	Optional attribute specification that uniquely identifies the NE or EM that assembled this trace file,
	according to the definitions in 3GPP TS 32.300 [11].
fileSender elementType	Optional attribute specification that identifies type of the network node that generated the file, e.g.
	"RNC", "SGSN".
traceCollec beginTime	This attribute specification contains a timestamp that refers to the start of the first trace data that is
	stored in this file. It is a complete timestamp including day, time and delta UTC hour. E.g. "2001-
	09-11T09:30:47-05:00".

- the DN prefix (attribute specification "arrefix") - the trace recording session identifier (attribute specification "tracesbessionRef") - the trace recording session identifier (attribute specification "tracesbessionRef") - the trace and of the cell (attribute specification "attribute") - the trace fine of the cell (attribute specification "tracesbessionRef") - the traced mean of the cell (attribute specification "tracesbession Refired Refi	XML element / XML attribute specification	Description
- the trace session identifier (attribute specification "tracecleses contect") - the start time of the call (attribute specification "strace(coloration the start time of the call (attribute specification "strace(coloration) the start time of the call (attribute specification "strace(coloration) the start time of the call (attribute specification) that provides the Diversity (see 3QPP TS 32 300 [11]). trace(see Seasion) - Attribute specification that provides a unique trace recording session identifier as described in tracease(coloration) attribute specification that provides a unique trace recording session identifier as described in tracease(coloration) attribute specification that provides a unique trace recording session identifier as described in 3QPP TS 32 402 [3]. Tracesec-Seasion at time. 10	traceRecSession	Optional element that contains the traced data associated to a Trace Recording Session. It includes:
- the trace recording session identifier (attribute specification "traceRecSensionRet") - the trace interest the de identifier (element "us") - the trace messages (elements "us") - the trace messages (elements "us") - the trace messages (elements "us") - the trace messages (element session identifier as described in Arrholds specification that provides a unique trace recording session identifier as described in Althous specification that provides a unique trace recording session identifier as described in Althous specification that provides a unique trace recording session identifier as described in Althous specification that provides a unique trace recording session identifier as described in Althous specification that provides a unique trace recording session identifier as described in Althous specification that provides the start time of the call. **TraceRecRecResion strine** - Althous specification that provides the start time of the call. **This element gives the use identifier provided in trace activation messages. It includes: - the us identifier value (attribute specification "id-rap") - the use identifier value (attribute specification "id-rap") - the use identifier value (attribute specification "id-rap") - This element option main associated to the traced message (attribute specification "changes") - This element value that indicates if the message is vendor specific (attribute specification "changes") - The time difference with attribute specification "name" of the protocol message (element "initiation") - The time difference with attribute specification "name" of the protocol message (element "initiation") - The protocol message (element "initiation") - The NE initiator of the protocol message (element "initiation") - The NE initiator of the protocol message (element "initiation") - The NE initiator of the protocol message (element "initiation") - The NE initiator of the protocol message (element "initiation") - The NE initiation while value (elements "initiation") - The encoded protocol message		
- the start time of the call (attribute specification "scime") - the use identifier (element "us") - the traced messages (elements "ms") - traceckedsesion directize - tracedsesion of the specification that provides the DN prefix (see 3GPP TS 32,300 [11]) tracedsesion of the specification that provides a unique trace session identifier as described in 3GPP TS 32,402 [12] tracedsesion of the specification that provides a unique trace session identifier as described in 3GPP TS 32,002 [13] tracedsesion activated - Annibute specification that provides a unique trace of the specification that provides the start time of the call tracedsesion activate - the use identifier provided in trace activation messages, it includes: - the use identifier type (attribute specification "1479;e") - the function name associated to the traced message, it includes: - the function name associated to the traced message (attribute specification "1479;e") - the function name associated to the traced message (attribute specification "1479;e") - the traced traced message (attribute specification "1479;e") - the traced described the specification "1479;e") - the NE target of the protocol message (element "1479;e") - the NE traced of the protocol message (element "1479;e") - the NE traced of the protocol message (element "1479;e") - the new traced of the protocol message (element "1479;e") - the new traced of the protocol message (element "1479;e") - the new traced of the protocol message (element "1479;e") - the traced of the protocol message (element		
- the traceReoSeasion dnPref x - the trace messages (element "un") - the trace messages (element seasings) - traces messages (element seasing) - the unitary message (element seasing) - the furnation name associated to the traced message (element septication) - the furnation changes (element seasing) - the message (element seasing) - the element seasing (elements seasong) - the element seasong (element seasong) - the message (element seasong) - the element seasong (element seasong) - the message (element seasong) - the element seasong elements seasong) - the element seasong elements (elements seasong) - the e		, , ,
Exceedes designed in the provision of th		
Attribute specification that provides a unique trace session identifier as described in 3GPP TS 32.412 [2]. TraceRecSession in Attribute specification that provides a unique trace recording session identifier as described in 3GPP TS 32.412 [a) and 3GPP TS 32.422 [3]. TraceRecSession at Imm. Optional attribute specification that provides the start time of the call. TraceRecSession at Imm. Optional attribute specification that provides the start time of the call. This element gives the us identifier provided in trace activation messages. It includes: the us identifier value (attribute specification "Lorype") the us dentifier value (attribute specification "Lorype") Attribute specification in a provides the us identifier type (MSI, IMEI (SV), or Private User Id). Attribute specification in a provides the using the provided in the specification "Lorybe" in the use dentifier type (attribute specification "Lorybe") the function name associated to a traced message, (It includes: the function name associated to the traced message, (It includes: the function name associated to the traced message, (It includes: the function in the difference with attribute specification "traceCollec beginning" (attribute specification "hange") the function and record attribute specification "traceCollec beginning" (attribute specification "hange") the NE initiator of the protocol message (element "initiator") the NE initiator of the protocol message (element "initiator") the necoded protocol message (element "

It includes: - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile Optional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol name associated to the event (attribute specification "protocol") - the protocol name associated to the event (e.g. "Rab parameters"). Optional element that contains a complex traced IE, i.e. an IE th		
Attribute specification that provides the function name associated to the traced message (e.g. luu, lu CS, lub, Intra frequency measurement, Gb,). msg changeTime Attribute specification that provides the time difference with attribute specification "traceCollec beginTime". It is expressed in number of seconds and milliseconds (nbsec.ms). Mag name Attribute specification whose value part is a boolean value that indicates if the message is vendor specific (true) or not (false). Mag name Attribute specification that provides the protocol message name. Optional element that identifies the NE initiator of the protocol message it includes: - the type of the network node that initiate the message (attribute specification "type") - the LDN of NE initiator of the protocol message (element's content). The element's content may be empty in case the initiator is the sender or the mobile Optional attribute specification that provides the type of the network node that initiate the message, e.g. "RNC", "SGSN". - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message, lement's content, The element's content may be empty in case the target is the sender or the mobile Attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message, It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol name associated to the event (attribute specification "protocol") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name")		- the encoded protocol message (element "rawMsg")
CS, lub, Intra frequency measurement, Gb,). msg changeTime Attribute specification that provides the time difference with attribute specification "traceCollec begintTime". It is expressed in number of seconds and milliseconds (ribsec.ms). Mag vendorSpecific Attribute specification whose value part is a boolean value that indicates if the message is vendor specific (true) or not (false). mag name Attribute specification that provides the protocol message name. Optional element that identifies the NE initiator of the protocol message. It includes: - the type of the network node that initiate the message (attribute specification "type") - the LDN of NE initiator of the protocol message (element's content). The element's content may be empty in case the initiator is the sender or the mobile Optional attribute specification that provides the type of the network node that initiate the message, e.g. "RNC", "SGSN". - the LDN of NE target of the protocol message (attribute specification "type") - the LDN of NE target of the protocol message (attribute specification "type") - the LDN of NE target of the protocol message (attribute specification "type") - the LDN of NE target of the protocol message (attribute specification "type") - the LDN of NE target of the protocol message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile target type Optional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". - the protocol variant she encoded protocol message. It includes: - the protocol variant she encoded protocol message. It includes: - the protocol version (attribute specification "version") - the protocol version (attribute specification "version") - the protocol version (attribute specification "version") - the leadering attribute specification that provides the protocol name associated to the event (e.g. "R		
Attribute specification that provides the time difference with attribute specification "traceCollec beginTime". It is expressed in number of seconds and milliseconds (nbsec.ms). Attribute specification whose value part is a boolean value that indicates if the message is vendor specific (true) or not (false). May a make attribute specification whose value part is a boolean value that indicates if the message is vendor specific (true) or not (false). May be empty in case the initiator of the protocol message, It includes: - the type of the network node that initiate the message, attribute specification "type") - the LDN of NE initiator of the protocol message (element's content). The element's content may be empty in case the initiator is the sender or the mobile initiator type Optional element that identifies the NE target of the protocol message, It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile target type Optional element that identifies the NE target of the protocol message, It includes: - the type of the network node that receive the message (element's content). The element's content may be empty in case the target is the sender or the mobile Optional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". Optional element that contains the encoded protocol message, It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol name associated to the event (attribute specification "protocol") - the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group value (attribute specification "value") - zero or more trac	msg function	
beginTime". It is expressed in number of seconds and milliseconds (hosec.ms).	msg changeTime	
specific (true) or not (false). Attribute specification that provides the protocol message name. Optional element that identifies the NE initiator of the protocol message. It includes: - the type of the network node that initiate the message (attribute specification "type") - the LDN of NE initiator of the protocol message (element's content). The element's content may be empty in case the initiator is the sender or the mobile Optional attribute specification that provides the type of the network node that initiate the message, e.g. "RNC", "SGSN". Optional element that identifies the NE target of the protocol message. It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the larget is the sender or the mobile target type Optional element that contains the encoded protocol message, it includes: - the protocol version (attribute specification "version") - the protocol version (attribute specification "version") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "name") Optional attribute specification that provides the IE group prame (e.g. "RAB parameters"). Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE name (attribute specification	3	· · · · · · · · · · · · · · · · · · ·
Attribute specification that provides the protocol message name. initiator Optional element that identifies the NE initiator of the protocol message. It includes: - the type of the network node that initiate the message (attribute specification "type") - the LDN of NE initiator of the protocol message (element's content). The element's content may be empty in case the initiator is the sender or the mobile initiator type Optional attribute specification that provides the type of the network node that initiate the message, e.g. "RNC", "SOSN". Optional element that identifies the NE target of the protocol message. It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile Optional element that contains the encoded protocol message. It includes: - the protocol message (element's content). The element's content may be engit in that provides the type of the network node that receive the message, e.g. "RNC", "SOSN". PawMsg Optional element that contains the encoded protocol message. It includes: - the protocol version (attribute specification "protocol") - the protocol version (attribute specification "protocol") - the protocol version (attribute specification "protocol") - the protocol version (attribute specification "nemaximum. **Rammag yersion** Attribute specification that provides the protocol name associated to the event (e.g. "Ramap"). - Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "name") - the IE group value (attribute specification that provides the IE group pame (e.g. "RAB parameters"). Optional element is available only if the trace depth is medium or minimum. Optional ele	msg vendorSpecific	
Optional element that identifies the NE initiator of the protocol message. It includes: - the type of the network node that initiate the message (element's content). The element's content may be empty in case the initiator is the sender or the mobile Optional attribute specification that provides the type of the network node that initiate the message, e.g. "RNC", "sGSN". Optional element that identifies the NE target of the protocol message. It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile Optional attribute specification that provides the type of the network node that receive the message (e.g. "RNC", "SGSN". Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). rawMsg version ieGroup Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. ieGroup value Optional attribute specification that provides the IE group value (e.g. "RAB parameters"). Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE value (element's content) This element is available only if the trace depth is m	mag nomo	
- the type of the network node that initiate the message (attribute specification "type") - the LDN of NE initiator of the protocol message (element's content). The element's content may be empty in case the initiator is the sender or the mobile Optional attribute specification that provides the type of the network node that initiate the message, e.g. "RNC", "SGSN". Optional element that identifies the NE target of the protocol message. It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile target type Optional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". Optional element that contains the encoded protocol message. It includes: - the protocol variance associated to the event (attribute specification "protocol") - the protocol variance associated form of the message (element's content) This element is available only if the trace depth is maximum. PawMsg version Attribute specification that provides the protocol variance in the total contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. ieGroup value Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE name (attribute specification "name") - the IE name (ettribute specification "name")		
may be empty in case the initiator is the sender or the mobile Optional attribute specification that provides the type of the network node that initiate the message, e.g. "RNC", "SGSN". Optional element that identifies the NE target of the protocol message. It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile Optional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". PawMsg Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. ieGroup value Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE name (attribute specification "name") - the IE value (elements content) This element is available only if the trace depth is medium or minimum.		- the type of the network node that initiate the message (attribute specification "type")
Optional attribute specification that provides the type of the network node that initiate the message, e.g. "RNC", "SGSN". Optional element that identifies the NE target of the protocol message, It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile Optional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. rawMsg protocol Attribute specification that provides the protocol version. Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). ieGroup value Optional attribute specification that provides the IE group value when it exists (e.g. "RAB identifier"). ie Uptional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE name (attribute specification "name") - the IE value (element's content) This element is available only if the trace depth is medium or minimum.		
e.g. "RNC", "SGSN". Optional element that identifies the NE target of the protocol message. It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile target type Optional altribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol name associated to the event (attribute specification "protocol") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. rawMsg protocol Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "name") - the IE group value (attribute specification "name") - the Ie element is available only if the trace depth is medium or minimum. ieGroup value Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). ieGroup value Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE name (element's content) This element is available only if the trace depth is medium or minimum.	initiator type	
Optional element that identifies the NE target of the protocol message. It includes: - the type of the network node that receive the message (attribute specification "type") - the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile target type Optional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). TawMsg version Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. ieGroup value Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). ieGroup value Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE name (element's content) This element is available only if the trace depth is medium or minimum.	initiator type	
- the LDN of NE target of the protocol message (element's content). The element's content may be empty in case the target is the sender or the mobile Deficial attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. ieGroup name Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). ieGroup value Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name")	target	
may be empty in case the target is the sender or the mobile Coptional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "SGSN". Coptional element that contains the encoded protocol message. It includes: The protocol name associated to the event (attribute specification "protocol") The protocol version (attribute specification "version") The hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. PawMsg protocol Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. TawMsg version Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: The IE group name (attribute specification "name") This element is available only if the trace depth is medium or minimum. Defional attribute specification that provides the IE group name (e.g. "RAB parameters"). Optional attribute specification that provides the IE group value when it exists (e.g. "RAB identifier"). Defional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: The IE name (attribute specification "name") This element is available only if the trace depth is medium or minimum. Take IE name (attribute specification "name") The IE name (attribute specification "name") This element is available only if the trace depth is medium or minimum.		
target type Optional attribute specification that provides the type of the network node that receive the message, e.g. "RNC", "GSSN". Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. ieGroup name Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). Optional attribute specification that provides the IE group value when it exists (e.g. "RAB identifier"). ie Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE value (element's content) This element is available only if the trace depth is medium or minimum.		
Optional element that contains the encoded protocol message. It includes: - the protocol name associated to the event (attribute specification "protocol") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. rawMsg protocol Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. ieGroup name Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). Optional attribute specification that provides the IE group value when it exists (e.g. "RAB identifier"). ie Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE value (element's content) This element is available only if the trace depth is medium or minimum.	target type	, , , ,
- the protocol name associated to the event (attribute specification "protocol") - the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. rawMsg protocol Attribute specification that provides the protocol name associated to the event (e.g. "Ranap"). Attribute specification that provides the protocol version. Optional element that contains a complex traced IE, i.e. an IE that contains other traced IEs. It includes: - the IE group name (attribute specification "name") - the IE group value (attribute specification "value") - zero or more traced IEs, either simple (elements "ie") or complex (elements "ieGroup"), in any order This element is available only if the trace depth is medium or minimum. ieGroup name Optional attribute specification that provides the IE group name (e.g. "RAB parameters"). ieGroup value Optional attribute specification that provides the IE group value when it exists (e.g. "RAB identifier"). ie Optional element that contains a simple traced IE, i.e. an IE decoded from the traced message. It includes: - the IE name (attribute specification "name") - the IE value (element's content) This element is available only if the trace depth is medium or minimum.		
- the protocol version (attribute specification "version") - the hexadecimal encoded form of the message (element's content) This element is available only if the trace depth is maximum. A.2 XML file format definition

For encoding of the information content, XML (see Extensible Markup Language (XML) 1.0, W3C Recommendation [5]) will be used. The XML schema contains the mark-up declarations that provide a grammar for the trace file format. The XML schema is defined below.

A.2.1 XML trace file diagram

The following figure describes the XML element structure of a trace XML file.

Note: Refer to "Symbol" paragraph for the symbols meaning

Figure: XML trace file diagram

A.2.2 Trace data file XML schema

The following XML schema traceData.xsd is the schema for trace data XML files:

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
    3GPP TS 32.423 Subscriber and Equipment Trace data definition and management
    Trace data file XML schema
    traceData.xsd
-->
```

```
<schema
 targetNamespace=
"http://www.3gpp.org/ftp/specs/latest/rel-6/32_series/32423-600.zip#traceData"
  elementFormDefault="qualified"
 xmlns="http://www.w3.org/2001/XMLSchema"
 xmlns:td=
"http://www.3gpp.org/ftp/specs/latest/rel-6/32_series/32423-600.zip#traceData"
  <!-- Trace data file root XML element -->
  <element name="traceCollecFile">
    <complexType>

</schema>

Annex B (normative): Trace Report File Conventions and Transfer Procedure

This annex describes naming conventions of files containing trace results and the procedure to transfer these files from the network to the NM.

B.1 File naming convention

The following convention shall be applied for trace result file naming:

<Type><Startdate>.<Starttime>-<SenderType>.<SenderName>.[<TraceReference>].[<TraceRecordingSessionRef>]

- 1) The Type field indicates if the file contains trace data for single or multiple calls, where:
 - "A" means single Trace Recording Session, single sender NE
 - "B" means multiple Trace Recording Sessions, single sender NE
- 2) The Startdate field indicates the date of the first record in the trace file. The Startdate field is of the form YYYYMMDD, where:
 - YYYY is the year in four-digit notation;
 - MM is the month in two digit notation (01 12);
 - DD is the day in two digit notation (01 31).
- 3) The Starttime field indicates the time of the first record in the trace file. The Starttime field is of the form HHMMshhmm, where:
 - HH is the two digit hour of the day (local time), based on 24 hour clock (00 23);
 - MM is the two digit minute of the hour (local time),
 - s is the sign of the local time differential from UTC (+ or -), in case the time differential to UTC is 0 then the sign may be arbitrarily set to "+" or "-";
 - hh is the two digit number of hours of the local time differential from UTC (00-23);
 - mm is the two digit number of minutes of the local time differential from UTC (00-59).
- 4) SenderType field is the type of NE defined by IOC attribute managedElementType in 3GPP TS 32.622 [12] that recorded and sent the trace file; SenderName field is the identifier of the NE that recorded and sent the trace file.
- 5) TraceRecordingSessionReference field is set only if the type field is A.
- 6) TraceReference field is set only if the type field is A.

Some examples describing file naming convention:

1) file name: A20030225.2315+0200-RNC.RNC01.01.125,

meaning: file produced by RNC<RNC01> on February 25, 2003, first trace record at 23:15 local with a time differential of +2 hours against UTC. The file contains trace data for the Trace Session with the Trace reference 01 and for the Trace Recording Session with the reference 125.

2) file name: B20030115.1700-0300-RNC.RNC02,

meaning: file produced by RNC<RNC02> on January 15, 2003, first trace record at 17:00 local with a time differential of -3 hours against UTC. The file contains trace data for several Trace Recording Sessions.

B.2 File transfer

- Data retrieval and storage mechanisms are vendor specific.
- There is no constraint on data retrieval periodicity.

Annex C (informative):

Trace Functional Architecture: Reporting

C.1 Figure of Trace Reporting

The following represents the trace reporting procedures.

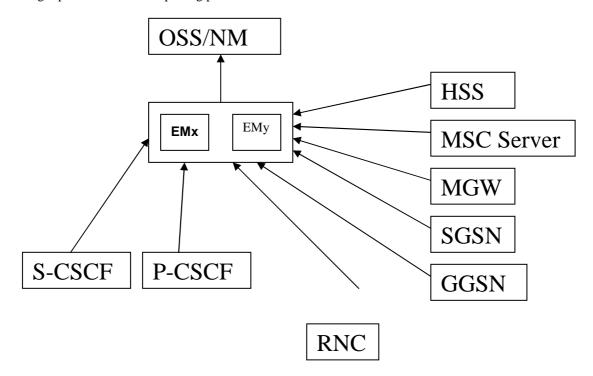

Figure C.1.1: Trace Reporting in System context A

Figure C.1.2: Trace Reporting in System Context B

Annex D (informative): Examples of trace files

D.1 Examples of trace XML file

D.1.1 Example of XML trace file with the maximum level of details

```
