Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://ipr.etsi.org).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

The present document is part 3 of a multi-part conformance test specification for the 3GPP evolved User Equipment (UE). The specification contains a TTCN-3 design frame work and the detailed test specifications in TTCN-3 for evolved UE at the UE-E-UTRAN radio interface.

- 3GPP TS 36.523-1 [1]: "User Equipment (UE) conformance specification; Part 1: Protocol conformance specification".
- 3GPP TS 36.523-2 [2]: "User Equipment (UE) conformance specification; Part 2: Implementation Conformance Statement (ICS) proforma specification".
- 3GPP TS 36.523-3: "Test Suites" (the present document).

1 Scope

The present document specifies the protocol and signalling conformance testing in TTCN-3 for the 3GPP UE at the UE-E-UTRAN radio interface.

The following TTCN test specification and design considerations can be found in the present document:

- the test system architecture;
- the overall test suite structure;
- the test models and ASP definitions:
- the test methods and usage of communication ports definitions;
- the test configurations;
- the design principles and assumptions;
- TTCN styles and conventions;
- the partial PIXIT proforma;
- the test suites.

The Abstract Test Suites designed in the document are based on the test cases specified in prose (3GPP TS 36.523-1 [1]). The applicability of the individual test cases is specified in the test ICS proforma specification (3GPP TS 36.523-2 [1]).

The present document is valid for UE implemented according to 3GPP Rel-9 upwards.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in TR 21.905 [26] apply.

3.2 Abbreviations

For the purposes of the present document, the abbreviations given in TR 21.905 [26] apply.

4 E-UTRAN/SAE system architecture and test models

4.1 Test system architecture

4.1.1 General system architecture

The general system architecture is shown in figure 4.1.1-1.

Figure 4.1.1-1: Architecture of system simulator

The scope of the present document is the TTCN-3 implementation of conformance tests. Specifications and definitions of the present document affect the codec and the system adaptor (SA). Test control and logging are out of scope as well as the interface between the TTCN-3 generated code and the system adaptor which can be either standardised TRI or proprietary.

The main assumptions regarding the system architecture are:

- TTCN-3 code runs on the host system only:
 - No TTCN-3 components are downloaded to system simulator HW.

- Layer 2 tests (MAC, RLC) are controlled by appropriate configuration primitives in TTCN-3 but neither layer 2 nor parts of it are implemented in TTCN-3; the system simulator performs low layer procedure autonomously but all system simulator implementations shall result in the same test pattern at the air interface.
- Proprietary interfaces e.g. instead of the TRI are not considered in the test model.
- The timing considerations of the conformance tests shall be supported by appropriate timing information (e.g. system frame number) provided from/to the system simulator rather than by timing measurements in TTCN-3.

4.1.2 Component architecture

For E-UTRAN conformance tests each access technology (RAT) is hosted by a separate TTCN-3 parallel component (PTC):

- E-UTRAN.
- UTRAN.
- GERAN.
- Other technologies like 3GPP2 UTRAN.

The PTCs are controlled by the TTCN-3 master test component (MTC) which:

- is independent from the RAT;
- may host the upper tester for MMI and AT commands;
- creates, synchronises and terminates the PTCs;
- starts and terminates test cases.

Figure 4.1.2-1 shows this component architecture for a E-UTRAN and UTRAN scenario.

Figure 4.1.2-1:E-UTRAN-UTRAN component model

According to this model there are different interfaces to be considered:

MTC - PTC:

- common synchronisation of PTCs;
- upper tester primitives.

MTC - System Interface:

- upper tester primitives.

PTC - PTC:

- primitives containing information for IRAT handover.

PTC - System Interface:

- primitives containing peer-to-peer message;
- configuration primitives.

4.2 E-UTRAN test models

4.2.1 Layer 2 test models

When test loop mode is used for the Layer 2 tests the DRB ports at the SS side is referred to the raw DRB ones. At the SS side, DRBs are initially configured with default modes and parameters. For the purpose of L2-testing the DRBs may be reconfigured later on as indicated in the subsequent test models (see below).

4.2.1.1 MAC test model

Figure 4.2.1.1-1: Test model for MAC testing

The UE is configured in Test Loop Mode, to loop back the user domain data above PDCP layer. On UE side Ciphering is enabled (since Mandatory) but with dummy ciphering algorithm, which is equivalent to not using ciphering. ROHC is not configured on UE Side.

On the SS Side, Layer 1 is configured in the normal way. MAC is configured in a special mode, where it does not add any MAC headers in DL and /or not remove any MAC headers in UL directions respectively at DRB port. In this case, the TTCN shall provide the final PDU, including padding. Except for this, the MAC layer shall perform all of its other functions.

On DRBs the RLC is configured in transparent mode. Hence with this configuration PDU's out of SS RLC are same as the SDU's in it. There is no PDCP configured on SS Side. The ports are directly above RLC.

There are two different test modes in which MAC header addition/removal can be configured:

DL/UL header-transparent mode: no header addition in DL and no header removal in UL.

DL only header-transparent mode: no header addition in DL; UL MAC is configured in normal mode to remove MAC header and dispatch the MAC SDUs according to the logical channel Ids.

If SS MAC is configured in DL/UL header-transparent mode, the PDU's exchanged at the DRB port between TTCN and SS, shall be the final MAC PDU's consisting of MAC, RLC and PDCP headers. TTCN code shall take care in DL

of building MAC header, RLC headers and PDCP headers and in UL handle MAC, RLC and PDCP headers. TTCN code shall take care of maintaining sequence numbers and state variables for RLC and PDCP layers. During testing of multiple DRBs at the UE side, it shall still be possible to configure only one DRB on SS side with configuration in the figure 4.2.1.1-1. Other DRBs will not be configured, to facilitate routing UL TBSs. Multiplexing/de-multiplexing of PDUs meant/from different DRBs shall be performed in TTCN. Since the MAC layer does not evaluate the MAC headers in UL it cannot distinguish between SRB and DRB data in UL. Therefore there shall be no SRB traffic while MAC is configured in this test mode.

If SS MAC is configured in DL only header-transparent mode, the UL PDUs exchanged at the DRB port between TTCN and SS, shall be final RLC PDUs consisting of RLC and PDCP headers. SS shall route these PDUs based on logical channel IDs. In DL, TTCN sends fully encoded MAC PDUs at the DRB port (consisting of MAC, RLC and PDCP headers). In this case TTCN needs to take care of maintaining sequence numbers and state variables for RLC and PDCP layers. Furthermore in UL and DL the SS MAC layer shall be capable of dealing with SRB data (i.e. it shall handle DL RLC PDUs coming from SRBs RLC layer or dispatch UL RLC PDUs to SRBs) as in normal mode.

NOTE: TTCN shall ensure that no DL MAC SDUs in normal mode and DL MAC PDUs in test mode are mixed for the same TTI.

The UL Scheduling Grant and DL Scheduling assignments are configured from TTCN over system control port. SS reports PUCCH scheduling information reception over system indication port, if configured. In a similar way the reception of RACH preambles is reported by SS over the same port.

4.2.1.2 RLC test model

Figure 4.2.1.2.3-1: Test model for RLC AM/UM testing

This model is suitable for testing both UM/AM mode of operation of DRBs on UE side.

The UE is configured in Test Loop Mode, to loop back the user domain data above PDCP layer. On UE side Ciphering is enabled (since mandatory) but with dummy ciphering algorithm, which is equivalent to not using ciphering. ROHC is not configured on UE Side.

On the SS Side, L1 and MAC are configured in the normal way. The RLC is configured in transparent mode. Hence with this configuration PDUs out of SS RLC are same as the SDUs in it. There is no PDCP configured on SS Side. The ports are directly above RLC.

The PDUs exchanged between TTCN and SS, shall be the final RLC PDUs consisting of RLC and PDCP headers. TTCN code shall take care in DL of building RLC headers and PDCP headers and in UL handle RLC and PDCP headers. TTCN code shall take care of maintaining sequence numbers and state variables for RLC and PDCP layers. If RLC on UE side is in AM mode, TTCN shall take care of generating polls in DL and responding with RLC control PDUs on reception of UL Poll.

The UL Scheduling Grant and DL Scheduling assignments are configured from TTCN over system control port.

4.2.1.3 PDCP test model

4.2.1.3.1 PDCP ROHC test model

Figure 4.2.1.3.1-1: Test model for PDCP ROHC testing

The UE is configured in Test Loop Mode, to loop back the user domain data above PDCP layer. On UE side Ciphering is enabled and ROHC is configured.

On the SS Side L1, MAC and RLC are configured in normal way. They shall perform all of their functions. The ports are above PDCP.

The PDCP is configured in special mode, with no header manipulation. Ciphering is configured in both directions. ROHC is configured in DL direction only. UL ROHC feedback can be injected by control ASP. It shall be possible to configure 'no header manipulation' mode independently in UL and DL directions. When configured in special mode, SS shall not add PDCP header (DL) and remove PDCP Header (UL). PDCP state variables shall be maintained by SS PDCP layer. It shall be possible for SS PDCP to update state variables based on the PDU's in both directions, even though headers are not added/removed. Also, it shall be possible to read or set the PDCP internal state variables, by control primitives.

The UL Scheduling Grant and DL Scheduling assignments are configured from TTCN over system control port. SS reports PUCCH scheduling information reception over system indication port, if configured.

4.2.1.3.2 PDCP test model (Non ROHC)

Figure 4.2.1.3.2-1: Test model for PDCP (Non ROHC) testing

The UE is configured in Test Loop Mode, to loop back the user domain data above PDCP layer. On UE side Ciphering is enabled and ROHC is not configured.

On the SS Side L1, MAC and RLC are configured in normal way. They shall perform all of their functions. The ports are above PDCP.

The PDCP is configured in a special mode, named transparent mode. In this mode, SS shall not add PDCP header (DL) and remove PDCP Header (UL). The TTCN maintains sequence numbers and state variables for the PDCP layer. The TTCN makes use of the AS ciphering functionality in both directions, employing the dummy ciphering algorithm. Ciphering/deciphering are performed using TTCN external functions. ROHC is not configured.

The UL Scheduling Grant and DL Scheduling assignments are configured from TTCN over system control port. SS reports PUCCH scheduling information reception over system indication port, if configured.

4.2.2 RRC test model

Figure 4.2.2-1: Test model for RRC testing

The UE is configured in normal mode. On UE side Ciphering/Integrity (PDCP and NAS) is enabled and ROHC is not configured.

On the SS Side L1, MAC, RLC and PDCP are configured in normal way. They shall perform all of their functions. For SRB0 the DL and UL port is above RLC. For SRB1 and SRB2 the port is above/below the RRC and NAS emulator,

which may be implemented as a parallel test component. For DRB, the port is above PDCP. PDCP Ciphering/Integrity is enabled. NAS integrity/Ciphering is enabled.

The RRC/NAS emulator for SRB1 and SRB2 shall provide the Ciphering and integrity functionality for the NAS messages. In UL direction, SS shall report RRC messages, still containing (where appropriate) the secure and encoded NAS message, to the RRC port. In DL, RRC and NAS messages with same timing information shall be embedded in one PDU after integrity and ciphering for NAS messages.

The UL Scheduling Grant and DL Scheduling assignments are configured from TTCN over system control port. SS reports PUCCH scheduling information reception over system indication port, if configured.

4.2.3 DRB test model

Figure 4.2.3-1: Test model for DRB testing

The UE is configured in Test Loop Mode, to loop back the user domain data above PDCP layer. Ciphering is optionally configured on UE side. In TTCN the DRB data is considered as raw data and there is no IP handling while the UE is in loopback mode.

On the SS Side L1, MAC, RLC and PDCP are configured in normal way. They shall perform all of their functions. The ports are above PDCP. When test loop mode is used for the DRB, the ports at the SS side refer to the raw DRB ones. Ciphering is enabled and ROHC is not configured on SS Side.

SS shall send in DL all PDU's received from different RB's but with same timing control information in one MAC PDU and in one TTI.

The UL Scheduling Grant and DL Scheduling assignments are configured from TTCN over system control port. SS reports PUCCH scheduling information reception over system indication port, if configured.

4.2.4 IP Test Model

Depending on different test scenarios user plane data can be distinguished in:

- Raw user data upon EUTRA PDCP (Raw mode);
- IP user data (IP mode).

The raw user data are applied for L2 or DRB tests, no IP protocols are involved. The UL user data is directly routed to the EUTRA_PTC.

The IP user data are applied when IP packets data are handled in TTCN. A DRB can have one or more Transport and Internet protocols configured.

Whether a DRB is in IP or in raw mode depends on the configuration of the routing table in the DBR-Mux. This is controlled by the IP CTRL port and independent from the configuration of the IP connections (IP SOCKET).

4.2.4.1 IP user data

To allow the usage of common protocol implementations at the system adaptor the related interfaces in TTCN-3 are based on the Sockets API.

There can be one or several sockets (server or client) for each DRB: TCP, UDP and ICMP.

Each socket can be clearly identified by the IP address, port number and the protocol (tcp|udp\icmp). It implies that a TCP socket can be either server or client.

It is assumed that:

- Different DRBs are not using the same sockets.
- The UE behaviour of a single IP-based protocol on a specific socket like DHCP can be included in conformance tests.
- Other protocols like ESP are not considered but can easily be introduced later, if necessary, by using the same socket approach.

The routing of IP packets from the IP stack to the DRBs in DL and from the DRBs either to the DRB port (E_DRB in case of EUTRA) or to the IP stack in UL is done by the DRB-Mux. This behaviour is controlled by the DRB-Mux's routing table.

The general architecture of the IP test model is shown in figure 4.2.4.1-1 (with a DHCP server as example for IP handling).

NOTE: In figure 4.2.4.1-1 DHCP is one example for a protocol above the IP stack; other protocols like DNS can also be implemented but this a pure TTCN implementation issue and independent from the system interface.

Figure 4.2.4.1-1: Example of IP test model with a DHCP server

4.2.4.2 Configuration of Sockets

The following configurations are controlled by the IP_PTC (IP_SOCKET_REQ). The socket configuration and the sending/receiving of data are done with the same ASP on the system port IP_SOCK.

4.2.4.2.1 Socket Establishment

TCP server

TCP socket configured as server: the socket 'listens' to a 'connect' from the UE. The socket can be configured by using the following system calls of the Berkeley Sockets API:

- socket (AF_INET | AF_INET6, SOCK_STREAM, 0);
- setsockopt;
- bind (local IP address Port);
- listen.

NOTE: Currently the only socket option being defined is SO_BROADCAST

When the UE connects to the server the connection is accepted with the 'accept' system call.

TCP client

A TCP connection is established to an existing TCP server at the UE side. This can be done with the following system calls:

- socket (AF_INET|AF_INET6, SOCK_STREAM, 0);
- setsockopt;
- connect (remote Server Addr of the UE = IP-Addr + Port).

UDP socket

A UDP socket can be established with the system calls

- socket (AF_INET|AF_INET6, SOCK_DGRAM, 0);
- setsockopt;
- bind (local IP address, Port);
- connect.

NOTE 1: 'setsockopt' can be used to set the option SO_BROADCAST to allow broadcast messages (e.g. for DHCP).

NOTE 2: Usage of 'connect' depends on implementation of the system adaptor.

4.2.4.2.2 Socket Release

A socket is released:

- in case of TCP when the remote entity closes the connection;
- when it is closed explicitly by the IP_PTC (system call 'close').

NOTE: In general the sockets are independent from the configuration of the DRBs. Especially in case of UDP or ICMP the sockets can exist even without any DRB being configured.

4.2.4.3 Handling of IP data

Sending and receiving of IP data is done by the same ASPs as the socket establishment on IP_SOCK. In TTCN the IP data are handled by a separate TTCN component: IP_PTC. This PTC can deal with the data according to the respective protocol, e.g. DHCP. In general, this is out of scope for the (signalling conformance) test case in terms of pass/fail assignment.

The IP_PTC will receive data from sockets being configured for the corresponding IP protocols. Any unrecognised IP packets are discarded by the IP stack in the system adaptor.

When the IP data is relevant for the test purpose, e.g. the test purpose is to test DHCP, the IP data are routed to the EUTRA_PTC. This allows generic protocol implementations for the common case, i.e. IP_PTC and DHCP server are independent from test case specific implementations.

The interface between EUTRA_PTC and IP_PTC is a pure TTCN implementation issue and independent of the system interface. Furthermore it is irrelevant for the system interface whether e.g. the DHCP server is part of the IP_PTC or implemented as a separate PTC.

- For TCP, the primitives to send and receive data correspond to the 'send' and 'recv' system calls.
- For UDP and ICMP, the primitives correspond to the 'sendto' and 'recvfrom' system calls.
- For both UDP and TCP the system adaptor may send ("in-band") error indications in case of system errors. That results in an assignment of incone by the IP_PTC.

4.2.4.4 Routing of IP Data

The routing of IP data is done in the DRB-Mux which gets a routing table configured. This table associates the address and protocol information of IP packets (protocol, local IP address, local port, remote IP address, remote port) with the radio bearer (RAT, cell, DRB id).

In UL a DRB is considered being in raw mode when there is no entry found in the routing table. It is considered being in IP mode when there is any entry regardless of the protocol and address information being stored, i.e. in UL, the SS does not need to evaluate the IP header to route the data (in raw mode this would cause problems in the case of loopback data).

In DL the IP packets of the IP stack are routed to the DRBs acc. to the routing information in the routing table (see annex D for details.

NOTE: Only the IP PTC can re-configure the Routing Table; if that needs to be triggered by a RAT specific PTC, this is done by appropriate coordination messages but the RAT specific PTCs don't have a direct access to the routing tables.

4.2.4.5 Multiple PDNs

In case multiple PDNs broadcast, or multicast datagrams sent by the UE, need to assigned to the respective PDN:

IPv4

When the UE does not get a valid IPv4 address assigned via NAS signalling it will request the IP address via DHCP. In this case there are DHCP broadcast messages in UL.

In the case of multiple PDNs, it cannot be distinguished by evaluating the IP address to which PDN the message belongs but additional information is necessary:

The network side needs to know which interface (i.e. network) the broadcast comes from; in case of LTE this is associated with the default bearer of the particular PDN.

NOTE: In principle the 'chaddr' field or the 'client identifier' option of the DHCP messages may be used to distinguish different interfaces (e.g. for ethernet this would be the MAC address) but it is not specified how these fields are to be used by the UE (or how to configure them at the UE); RFCs (e.g. RFC 2131) only require the client identifier to be unique in a given subnet.

IPv6

The UE gets an interface identifier assigned via NAS signalling (TS 24.301 [21] clause 6.2.2) which is used as link-local address during stateless address autoconfiguration (TS 23.060 [43] clause 9.2.1.1 and TS 29.061 [44] clause 11.2):

The UE may send a ROUTER SOLICITATION message (multicast) to which the network responds with a ROUTER ADVERTISEMENT.

Since the ROUTER SOLICITATION message contains the interface identifier as assigned via NAS signalling, even in the case of multiple PDNs it can distinguished which PDN is concerned, as long as the interface identifiers are different for different PDNs (for UE side as well as for network side).

NOTE: According to TS 23.060 [43] clause 9.2.1.1 and RFC 3314 a real network (PDN-GW) itself shall send an (unsolicited) ROUTER ADVERTISEMENT after it has assigned the interface identifier.

Conclusions and Requirements:

In the case of broadcast or multicast messages TTCN needs additional information about the PDN being addressed.

When a socket connection is configured to allow broadcasts and there is a broadcast or multicast message in UL the SS shall provide information about on which bearer the datagram has been sent (RAT, cell, DRB id).

NOTE: From the socket programming point of view multiple PDNs for the SS are like a multi-homed host: Servers for different interfaces are bound to different interfaces (e.g. using the 'bind' system call with a specific IP address instead of IPADDR_ANY) or a server may retrieve the interface id for a received datagram from the IP stack with an appropriate system call.

Even though the details are implementation dependent, the SS shall be capable of:

determining RAT, cell, DRB id for any broadcast or multicast datagram in UL

avoiding any duplication of messages in UL even when multiple servers are listening to broadcast/multicast messages (what is a possible SS implementation)

4.2.4.6 IP Addresses Guidelines

4.2.4.6.1 Common Structure of IP Addresses

IPv4:

Network prefix (subnet address) n bits

Host part 32-n bits

with 'n' e.g. depending on the network class

IPv6:

Network prefix

Global routing prefix 64 - n bits

Subnet ID n bits

Interface ID 64 bits

Addresses within one network (PDN) have all the same subnet address (IPv4) or global routing prefix (IPv6)

NOTE: As a consequence at the system simulator, routing can be done based on appropriate network masks, but that is dependent on SS implementation and therefore is out of scope for this document.

4.2.4.6.2 Common Requirements regarding IP Addresses

IP addresses are configured via PIXIT parameters as defined in clause 9.1.

These PIXIT parameters shall fulfil the following requirements:

Network and UE addresses shall be different from each other

Network entities (DHCP server, DNS server, P-CSCF etc.) of a given PDN shall all have the same global routing prefix (IPv6) or subnet address (IPv4).

The IP address assigned to the UE shall have the same global routing prefix (IPv6) or subnet address (IPv4) as the corresponding network.

Requirements for IPv6: according to TS 23.401, cl. 5.3.1.2.2

The 64 bit network prefix of a UE's IPv6 address is unique

The UE may change its interface id during auto configuration

The UE must use the given interface id in the link local address for router solicitation but may use any other interface id in the global address

NOTE: As a consequence, the SS implementation needs to cope with the changing of the UE address and cannot rely on static IP address assignment to the UE.

Global routing prefix (IPv6) and subnet address (IPv4) shall be different for different PDNs

Home agent address:

The home agent is located in the UE's home network (which shall be considered to find an appropriate network prefix for the home agent's IP address)

In order to simplify implementations, the following rules shall be applied:

The IPv6 interface identifier as assigned to the UE via NAS signalling shall be unique, i.e.

It shall be different for different PDNs

It shall differ from the interface ids of the other entities on the link (in general the interface id of the PDN-GW)

Multiple PDNs shall have different IPv6 interface identifier for the PDN-GW

NOTE: Consistency checks for addresses of different PDNs can be done based on an appropriate network mask (IPv4, e.g. 255.255.255.0) and global routing prefix (IPv6, e.g. 2001:db8:1234::/48).

4.2.4.7 User Plane Signalling for Address Allocation

For IPv4, the UE gets assigned the IP address via NAS signalling unless it explicitly requests to use DHCP.

For IPv6, the UE gets assigned a unique interface identifier to be used until it has successfully performed the auto-configuration procedure (Ref. to RFC 2462).

NOTE: This clause specifies behaviour of the SS (TTCN) to achieve successful IP signalling; but in general, IP signalling is out of scope for conformance tests as defined in TS 36.523-1 [1].

4.2.4.7.1 DHCP

When the UE supports IPv4 and does not get an IPv4 address via NAS signalling it will request the address via DHCP (Ref. to RFC2131).

The UE may send a **DHCPDISCOVER** with or without Rapid Commit Option (Ref. to RFC 4039):

UE sends **DHCPDISCOVER** according to table 4.2.4.7.1-1 with Rapid Commit Option.

TTCN sends **DHCPACK** according to table 4.2.4.7.1-4

UE sends **DHCPDISCOVER** according to table 4.2.4.7.1-1 without Rapid Commit Option.

TTCN sends **DHCPOFFER** according to table 4.2.4.7.1-2

When the Rapid Commit option is not used the UE sends a DHCPREQUEST as response to the DHCPOFFER:

UE sends **DHCPREQUEST** according to table 4.2.4.7.1-3

TTCN sends **DHCPACK** according to table 4.2.4.7.1-4

Any other DHCP messages shall be ignored by TTCN.

4.2.4.7.2 DHCPv6

DHCPv6 is not needed for E-UTRA conformance tests as defined in 36.523-1[1]

4.2.4.7.3 ICMPv6

When the UE supports IPv6 it will perform IPv6 Stateless Address Auto configuration according to RFC 4862. The UE sends an **ICMPv6 Router Solicitation** message according to table 4.2.4.7.3-1; as response the TTCN sends an **ICMPv6 Router Advertisement** message according to table 4.2.4.7.3-2.

NOTE: The TTCN does not send any (periodic) unsolicited Router Advertisement, i.e. the UE is expected to ask for an immediate advertisement whenever it is needed.

Any other ICMPv6 messages are ignored by the TTCN (especially in accordance to TS 23.060, clause 9.2.1.1, the TTCN silently discards Neighbour Solicitation).

Table 4.2.4.7.3-1: ICMPv6 Router Solicitation

IPv6				
SRC ADDR	link local address	NOTE 1		
DEST ADDR	multicast address	NOTE 2

	the UE			
NOTE 1: The server's link local address is derived from the server's global IPV6 address (PIXIT parameter)				

NOTE 1: The server's link local address is derived from the server's global IPV6 address (PIXIT parameter)

NOTE 2: As received as SRC address of the corresponding Router Solicitation

NOTE 3: Acc. to TS 29.062 clause 11.2.1.3.2

NOTE 4: The routing prefix of the UE's global IPv6 address is derived from the respective PIXIT parameter NOTE 5: Since the UE may change its interface identifier after successful auto configuration to any value in general the IPv6 address used by the UE differs from the PIXIT

4.2.4.7.4 DNS

DNS is not needed for E-UTRA conformance tests as defined in 36.523-1[1].

4.2.5 IP model extension for IMS

The IMS test model is based on the IP Test Model with extensions to support IPsec. Support of Signalling Compression (SigComp) may be added in the future if needed.

IMS in general may use TCP, UDP or alternated TCP/UDP as transport layer for signalling messages.

At TTCN-3 system interface level there are no IMS specific ports or ASPs, i.e. IMS specific issues are purely handled in TTCN and therefore out of scope for this document.

NOTE: Even though the main intention to introduce the IMS test model is to support the initial IMS registration procedure, the IMS test model is independent of any specific IMS procedures.

Figure 4.2.5-1: Example for IP model supporting IMS

NOTE 1: At the system interface IPsec is the only difference compared to the IP model of clause 4.2.4

NOTE 2: It is a working assumption to have a separate PTC for IMS as shown in figure 4.2.5-1

NOTE 3: Ports between the IP_PTC and the IMS_PTC are for illustration only

4.2.5.1 IPsec

IPsec involves security policy database (SPD) and security association database (SAD) (Ref. RFC4301). The entries in the databases are configured with security parameters by ASPs at the IPsec_CTRL port.

NOTE: IPsec is not directly associated to a given socket but IPsec is applied to IP packets matching a configured security association. \Rightarrow configuration of IPsec in general is independent of the existence of sockets but typically the IPsec configuration is done just before establishment of a corresponding socket.

The SS shall cleanup all IPsec database entries which has been setup by TTCN during a test case at the end of the test case independent of how the test case terminates (normal termination, run-time error etc.)

4.2.5.1.1 Security Association

NOTE: Within this clause SA is used as abbreviation of 'Security Association' (i.e. not as abbreviation for 'System Adaptor' as usual)

During the IMS signalling handling two pairs of SAs consisting of four unidirectional SAs will be used, one pair of SAs (SA2 and SA4) is between the server port of UE and the client port of the SS, another pair of SAs (SA1 and SA3) is between the client port of UE and the server port of the SS, see figure 4.2.5.2.3.1-1.

Figure 4.2.5.2.3.1-1 Two pairs of SAs

SA1 used for data flow from port_uc to port_ps is an inbound SA for protected server port of P-CSCF, its Security Parameter Index spi_ps is selected by P-CSCF (IMS Registration/Authentication function in IP_PTC) and presented in 401 Unauthorised; SA2 used for data flow from port_pc to port_us is an inbound SA for protected server port of UE, its Security Parameter Index spi_us is selected by UE and presented in initial REGISTER message; SA3 used for data flow from port_ps to port_uc is an inbound SA for protected client port of UE, its Security Parameter Index spi_uc is selected by UE and presented in initial REGISTER message; SA4 used for data flow from port_us to port_pc via an inbound SA for client port of P-CSCF, its Security Parameter Index spi_pc is selected by P-CSCF (IMS Registration/Authentication function in IP_PTC) and presented in 401 Unauthorised message. The pair of SA1 and SA3 is for bidirectional traffic between port_uc and port_ps. The pair of SA2 and SA4 is for bidirectional traffic between port_pc and port_us. Those four spi_xx and other security parameters are negotiated during security association set up procedure and shall be passed to IPsec protocol layer in the SS. See "SAD and SPD" and clause 7.2 of TS 33.203 [41].

These four unidirectional SA and relevant ports are shared by TCP and UDP. TCP transport will use all four SAs, UDP transport uses only two SAs, because there is no traffic from port_ps to port_uc, nor from port_us to port_pc. Figure 4.2.5.2.3.1-2 shows the usage of ports and SAs under UDP and TCP transport in a generic registration procedure (see clause C.2 of TS 34.229-1 [40]).

Figure 4.2.5.2.3.1-2: Usage of ports and SAs in UDP and TCP transport

4.2.5.1.2 SAD and SPD

SAD and SPD are used by IPsec to store various security parameters (per Security Association). During IMS AKA, the UE and the IMS Registration/Authentication function in IP_PTC negotiates the negotiable parameters for security association setup, this negotiation is carried out at the SIP level in TTCN-3, and the resulting security association parameters are maintained in TTCN-3. The involved parameters are:

spi_uc; spi_us; spi_pc; spi_ps

encryption algorithm

integrity algorithm

The IMS AKA will generate key IK_{IM}, the security parameters IK_{ESP} and CK_{ESP} are derived from IK_{IM} and CK_{IM} in TTCN-3 (Ref. Annex I of TS 33.203[41]). ASPs are used to pass these parameters (per security association and with its selectors) from TTCN-3 to SAD and SPD of IPsec layer in the SS.

The same IK_{ESP} and CK_{ESP} will be used for the four unidirectional SAs. All of the four unidirectional SAs will use the same negotiated encryption algorithm and integrity algorithm.

In addition to those negotiable security parameters, other security parameters are fixed in IMS environment (see clause 7.1 of TS 33.203 [41]):

Life type: second $2^{32}-1$

Mode: transport

ESP, ESP integrity applied IPsec protocol:

Key length: 192 bits for DES-EDES CBC, 128 bits for AES-CBC and HMAC-MD5-96; 160 bits

for HMAC-SHA-1-96

These parameters are hard coded with IPsec implementation in the SS, not passed from TTCN-3.

An SA have to be bound to selectors (specific parameters) of the data flows between UE and P-CSCF (IMS Registration/Authentication function in IP_PTC), the selectors are:

source IP address

SA duration:

destination IP address

source port

destination port

transport protocols that share the SA

IP addresses bound to the two pairs of SAs are:

For inbound SAs at the P-CSCF (the SS side):

The source and destination IP addresses associated with the SA are identical to those in the header of the IP packet in which the initial SIP REGISTER message was received by the P-CSCF.

For outbound SAs at the P-CSCF (the SS side):

The source IP address bound to the outbound SA equals the destination IP address bound to the inbound SA; the destination IP address bound to the outbound SA equals the source IP address bound to the inbound SA.

Ports bound to the two pairs of SAs are depictured in figure 4.2.5.2.3.1-1, port_ps and port_pc shall be different from the default SIP ports 5060 and 5061. The number of the ports port ps and port pc are communicated to the UE during the security association setup procedure.

The transport protocol selector shall allow UDP and TCP.

The selectors are passed to the SS IPsec layer together with the security parameters related to an SA bound to the selectors.

4.2.5.2 Signalling Compression (SigComp)

Signalling compression is mandatory (see clause 8 of TS 24.229 [42]) and Signalling compression (RFC 3320 [43], RFC 3485 [44], RFC 3486 [45], RFC 4896 [46], RFC 5049 [47]) protocol is used for SIP compression. SigComp entity in the model is used to carry out the compression/decompression functions. In receiving direction of the SS the SigComp entity will detect whether the incoming SIP message is compressed, and decompress the message if it is

compressed. In the SS transmitting direction, the TTCN, via ASP, controls when the compression of outgoing SIP message is started. Stateless compression is not used in the SIP environment. For state full operation of SigComp the ASP passing compartment ID to SigComp is applied. The SS shall clean all states related to a connection in SigComp when an ASP for closing the connection is received. The SS shall also clean all states in the SigComp when abortion of a test case is detected or after the system reboots. If decompression failure occurs while decompressing a message, the message shall be discarded. The SigComp entity in the SS shall automatically find if a secure port or un-secure port is being used for transmission or reception of messages. If an un-secure port is used for transmission, it shall not include state creation instructions. If the state creation command is received in a compressed message on an un-secured port, a decompression failure shall be generated.

4.2.5.3 SIP TTCN-3 Codec

SIP is a text-based protocol, the messages exchanged between the UE and the SS are character strings. In TTCN-3 the messages are structured to take the advantages of TTCN-3 functionalities, and to make the debugging and maintenance easier.

Even though there is no encoding/decoding of SIP messages at the TTCN-3 system interface, the IMS_PTC uses the SIP codec by means of the TTCN-3 build-in functions encoulue and decoalue.

The SIP codec is specified in TS 34.229-3 [45] clause 7.

4.2.6 Support of DSMIPv6

For testing of DSMIPv6 IP packets being relevant for the test cases may be routed by the IP_PTC to the PTCs with specific test case implementation. There are not specific requirements for the system interface.

The functions of HA and ePDG are FFS.

4.3 SAE Test Model

4.3.1 NAS Test Model

Figure 4.3.1-1: NAS Test Model

The NAS emulator is a parallel test component which handles NAS security, with the help of external functions to perform the integrity and (de)ciphering.

The interface between the emulator and the TTCN (co-ordination messages) handle data as TTCN-3 values. The interface between the emulator and the SS handles the RRC messages as TTCN-3 values, containing (where applicable) secure, encoded NAS messages.

The NAS emulator is not part of the test case in terms of verdict assignment (i.e. it does not check the correctness of any protocol message). Nevertheless, in case of fatal errors such as encode/decode errors, the NAS emulator sets the verdict to inconclusive and terminates immediately - which causes the test case to terminate. i.e. the NAS emulator does not resolve error situations.

4.4 Inter RAT Test Model

4.4.1 E-UTRAN-UTRAN Inter RAT Test Model

Figure 4.4.1-1: Test model for Inter RAT E-UTRAN-UTRAN testing

The model consists of dual protocol stack one for E-UTRAN and one for UTRAN. The TTCN implementation for E-UTRAN and UTRAN functionalities will be in separate Parallel Test Components. The SS E-UTRAN part is same as the model defined in clause 4.2.2 for RRC testing.

The SS UTRAN part consist of L1, MAC, RLC and PDCP (IF PS user RB established only), are configured in normal mode. They shall perform all of their functions normally. Ciphering is enabled and shall be performed in RLC (AM/UM) and MAC (TM RLC). Integrity is enabled, and SS shall provide RRC emulator for integrity protection calculation and checking and 'Direct transfer' adaptation. Ports are above RLC (CS RAB and SRB0), PDCP (PS RAB) and RRC Emulator (SRB1 to SRB4).

The UE is configured in normal mode. Ciphering/Integrity (PDCP and NAS) are enabled and ROHC is not configured in E-UTRAN. Ciphering is enabled in UTRAN.

4.4.2 E-UTRAN-GERAN Inter RAT Test Model

Figure 4.4.2-1: Test model for Inter RAT E-UTRAN-GERAN testing

The model consists of dual protocol stack one for E-UTRAN and one for GERAN. The TTCN implementation for E-UTRAN and GERAN functionalities will be in separate Parallel Test Components. The SS E-UTRAN part is the same as the model defined in clause 4.2.2 for RRC testing.

The SS GERAN model for GPRS consists of L1, MAC/ RLC and LLC, configured in normal mode. SNDCP may also be configured. They shall perform all of their functions normally. Ciphering is enabled and shall be performed in LLC. Ports are above RLC (GRR messages), LLC (NAS and Data) and SNDCP (User Data).

The SS GERAN model for GSM consists of L1, L2 (MAC/ RLC), configured in normal mode. They shall perform all of their functions normally. Ciphering is enabled and shall be performed in L1. Ports are above L2.

The UE is configured in normal mode. Ciphering/Integrity (PDCP and NAS) is enabled and ROHC is not configured in E-UTRAN. Ciphering is enabled in GERAN.

4.4.3 E-UTRAN-CDMA2000 Inter RAT Test Model

4.4.3.1 E-UTRAN-CDMA2000 HRPD Inter RAT Test Model

Figure 4.4.3-1: Test model for InterRAT E-UTRAN-CDMA2000 HRPD testing

The model consists of a dual protocol stack, one for E-UTRAN and one for eHRPD. The TTCN implementation for E-UTRAN and eHRPD functionalities will be in separate Parallel Test Components. The SS E-UTRAN part is same as the model defined in clause 4.2.2 for RRC testing.

The eHRPD part emulation in SS is considered as a black box. The commands/Indications port is used for commanding the SS to bring the UE into the desired state and monitoring the progress. The System commands and indications are designed with principle of having minimum command/indication per eHRPD procedure hence avoid racing conditions and timing issues. By default, the execution order of sub procedures (e.g. protocol negotiations) cannot be monitored by TTCN. The SS emulations shall be compliant with respective 3GPP/3GPP2 core specifications and guarantee execution order of respective eHRPD procedures as per relevant 3GPP/3GPP2 test/core specifications.

The C2KTUNNEL port is used for routing encapsulated

- 1. pre-registration messages (i.e. messages encapsulated in *ULInformationTransfer* and *DLInformationTransfer*) in the EUTRAN cell to the eHRPD and
- 2. handover related eHRPD messages (i.e. messages encapsulated in *HandoverFromEUTRAPreparationRequest/ULHandoverPreparationTransfer/MobilityFromEUTRACommand*).

The SS eHRPD part consists of Physical, MAC, Security, Connection, Session, Stream, Application and Layers for PPP and IP configured in normal mode. They shall perform all of their functions normally. Encryption may be enabled and performed in security layer.

The CDMA2000 eHRPD emulation in the SS supports the following layers and protocols:

- Physical layer (Subtype 2).
- MAC layer:
 - Enhanced (Subtype 0, Subtype 1) Control Channel MAC Protocol (ECH).
 - Enhanced (Subtype 1) Forward Traffic Channel MAC Protocol (E-F-TCH).
 - Enhanced (Subtype 1) Access Channel MAC Protocol (E-ACH).
 - Subtype 3 Reverse Traffic Channel MAC Protocol (R-TCH).
- Security Layer:
 - Default Security Protocol (Security).
- Connection Layer:
 - Default Air Link Management Protocol (ALMP).
 - Default Connected State Protocol (CSP).
 - Default Packet Consolidation Protocol (PCP).
 - Inter-RAT Signalling Adaptation Protocol (IR-SAP) (required only for optimized handover).
 - Inter-RAT Initialization State Protocol (IR-Init SP) (required only for optimized handover).
 - Inter-RAT Idle State Protocol (IR-Idle SP) (required only for optimized handover).
 - Inter-RAT Route Update Protocol (IR-RUP) (required only for optimized handover).
 - Inter-RAT Overhead Messages Protocol (IR-OMP) (required only for optimized handover).
- Session Layer:
 - Default Session Management Protocol (SMP).
 - Default Address Management Protocol (AMP).
 - Default Session Configuration Protocol (SCP).
- Stream Layer:

- Default Stream Protocol (DSP).
- Application Layer:
 - Default Signalling Application:
 - Signalling Network Protocol (SNP).
 - Signalling Link Protocol (SLP).
 - Enhanced Multi-Flow Packet Application:
 - Route Selection Protocol (RSP).
 - Radio Link Protocol (RLP).
 - Location Update Protocol (LUP).
 - Flow Control Protocol (FCP).
 - Alternate Enhanced Multi-Flow Packet Application (to be listed along with EMPA during SCP negotiation)
- Above eHRPD:
 - PPP: Vendor Specific Network Control Protocol (PPP:VSNCP).
 - PPP: Vendor Specific Network Protocol (PPP:VSNP).
 - PPP: Link Control Protocol (PPP:LCP).
 - PPP: Extensible Authentication protocol-Authentication and Key Agreement' (PPP:EAP-AKA').
 - IPv4.
 - IPv6.

During pre-registration phase, one cell per preRegistrationZoneID (ColorCode) to be simulated will be configured by TTCN with power level as 'off', or as specified by the test case. The SS will be issued System commands for pre-registration and expect the appropriate system indications.

The UE is configured in normal mode. Ciphering/Integrity (PDCP and NAS) are enabled and ROHC is not configured in E-UTRAN. Encryption is enabled in HRPD.

4.4.3.2 E-UTRAN-CDMA2000 1xRTT Inter RAT test model

Figure 4.4.3.2-1: Test model for InterRAT E-UTRAN-CDMA2000 1xRTT testing

The 1xRTT test model consists of a dual protocol stack, one for E-UTRAN and one for 1xRTT. The TTCN implementation for E-UTRAN and 1xRTT functionalities are in separate Parallel Test Components. The SS E-UTRAN part is same as the model defined in clause 4.2.2 for RRC testing.

The 1xRTT part emulation in SS is considered as a black box. The commands/Indications port is used for commanding the SS to bring the UE into the desired state and monitoring the progress. The System commands and indications are designed with principle of having minimum command/indication per 1xRTT procedures hence avoid racing conditions and timing issues. By default, the execution order of sub procedures(e.g. protocol negotiations) cannot be monitored by TTCN. The SS emulations shall be compliant with respective 3GPP/3GPP2 core specifications and guarantee execution order of respective 1xRTT procedures as per relevant 3GPP/3GPP2 test/core specifications.

The C2KTUNNEL port is used for routing encapsulated

- 1. pre-registration messages (i.e. messages encapsulated in *CSFBParametersResponseCDMA2000*, *ULInformationTransfer* and *DLInformationTransfer*) in the EUTRAN cell to the 1xRTT and
- 2. handover, e-CSFB related 1xRTT messages (i.e. messages encapsulated in *HandoverFromEUTRAPreparationRequest/ ULHandoverPreparationTransfer/ MobilityFromEUTRACommand*).

The SS 1xRTT part consists of Physical, MAC, LAC, Session, Stream, Application and Layers for PPP and IP configured in normal mode. They shall perform all of their functions normally. Encryption may be enabled and performed in security layer.

The CDMA2000 1xRTT emulation in the SS supports the following layers and protocols:

- Physical layer.
- MAC layer:
 - Signalling Radio Burst protocol.
 - Radio Link Protocol for Data services.
 - Forward and Reverse Packet Data Channel functions.
 - Multiplexing and QoS Delivery.
- Link Access Control:
 - Authentication and Message Integrity sublayer [optional].
 - ARQ sublayer.
 - Addressing.
 - Utility.
 - Segmentation and Reassembly.
- Layer 3:
 - Super visioning and Configuration Management.
 - Signalling Protocol.

During pre-registration phase, one cell per preRegistrationZoneID (ColourCode) to be simulated will be configured by TTCN with power level as 'off', or as specified by the test case. The SS will be issued System commands for pre-registration and expect the appropriate system indications.

The UE is configured in normal mode or loop back mode. Ciphering/Integrity (PDCP and NAS) are enabled and ROHC is not configured in E-UTRAN. Encryption may be enabled in 1xRTT.

4.4.4 E-UTRAN FDD-TDD Inter RAT Test Model

Figure 4.4.4-1: Test model for Inter RAT E-UTRANFDD-TDD testing

The model consists of dual protocol stack one for E-UTRANFDD and one for E-UTRANTDD. The TTCN implementation for E-UTRANFDD and TDD functionalities will be in the same Parallel Test Component. The SS E-UTRAN (both FDD and TDD) part is the same as the model defined in clause 4.2.2 for RRC testing. SS E-UTRANFDD and TDD shall be configured as separate cells.

The UE is configured in normal mode. Ciphering/Integrity (PDCP and NAS) are enabled and ROHC is not configured for both FDD and TDD.

4.4.5 E-UTRAN-UTRAN-GERAN Inter RAT Test Model

Figure 4.4.5-1: Test model for Inter RAT E-UTRANFDD-TDD testing

The model consists of integrated protocol stack supporting E-UTRAN, UTRAN and GERAN. The TTCN implementation for E-UTRAN, UTRAN and GERAN functionalities will be in separate Parallel Test Components. The SS E-UTRAN part is the same as the model defined in clause 4.2.2 for RRC testing. The SS UTRAN part is the same as the model defined in clause 4.4.1. The SS GERAN part is same as the model defined in clause 4.4.2.

The UE is configured in normal mode. Ciphering/Integrity (PDCP and NAS) are enabled and ROHC is not configured in E-UTRAN. Ciphering/Integrity are enabled in UTRAN. Ciphering is enabled in GERAN.

5 Upper Tester Interface

This clause describes the handling of AT commands and MMI Commands at the system interface. The internal handling of those commands in TTCN is out of scope.

In the TTCN, the Upper Tester is located at the MTC; therefore there is one interface to the system adaptor common for all RATs.

There is one primitive defined carrying either an MMI or an AT command to be sent to the system adaptor and one common confirmation primitive to be sent by the system adaptor.

		TTCN-3 ASP D	efinition	
Type Name	UT_SYSTEM_REG	Į		
TTCN-3 Type	Record			
Cmd		TTCN-3 Type		union

		true: success		
		false: failure		
ResultString		TTCN-3 Type	charstring	
	•	response by the UE for commands which request the UE to return a		
		result, optional		

All mandatory and optional AT commands are sent as AT command strings as defined above. If an optional AT command is not implemented in the UE, the system adaptor needs to parse the AT command and map it to an appropriate MMI command (which is out of scope for this document).

The following MMI commands are defined.

Table 5.1: MMI commands

Command	Param	neters

6 ASP specifications

6.1 General Requirements and Assumptions

The following common requirements affect ASP definitions:

- The definition of ASPs shall have no impact on the common system architecture or on the performance.
- The codec implementation is out of scope of the present document.
- For peer-to-peer PDUs contained in an ASP encoding rules need to be considered acc. to the respective protocol:
 - ASN.1 BER and PER.
 - Tabular notation for NAS PDUs or layer 2 data PDUs.

There are no encoding rules being defined for top level ASP definitions and information exchanged between the test executable and the System Adaptor (SA) only. Instead encoding depends on implementation of the codec and the SA.

There are no encoding rules being defined for ASPs between TTCN-3 components. This is implementation dependent.

Info elements defined in the protocol specifications (e.g. RRC) shall be re-used in configuration ASPs as far as possible.

For optional fields within the configuration ASPs, the following rules will be applied:

- For ASN.1 fields these will follow the same rules as defined in the RRC specification [19].
- For TTCN-3 fields when the current configuration of an optional field is to be 'kept as it is' then the field will be set to omit.

- For TTCN-3 fields - when the current configuration of an optional field is to be released/deleted then a separate option is provided in a union.

6.1.1 IP ASP requirements

6.1.2 Enhancement of IP ASP for handling IMS signalling

The IMS test model handling registration signalling introduces IPsec and SigComp layers into the IP test model in Figure 4.2.5.2-1. The ASP on system port IP_SOCK needs to be enhanced to provide additional configuration/control functions for IPsec and SigComp. The enhanced IP ASP should contain:

- 1. Function to clean all IPsec and SigComp configurations and to put the IPsec and SigComp in the initial state.
- 2. Function to return SigComp layer a Compartment Id instructing SigComp layer to save the state of a received message which was compressed.
- 3. Function to start or stop signalling compression in sending direction (the SS to the UE) of SigComp.
- 4. Function to set security parameters (per security association) in IPsec layer.
- 5. A flag indicating whether SigComp layer shall be included in the data path when establishing a connection.
- 6. A flag indicating whether the received message was compressed by SigComp.
- 7. A parameter to point to a compartment used by SigComp to send a message.

6.2 E-UTRAN ASP Definitions

Figure 6.2-1: E-UTRAN ASP Test Model

6.2.1 Configuration Primitives

Annex D contains the ASP definitions for configurations.

6.2.2 Signalling Primitives

Annex D contains the ASP definitions for configurations.

7 Test Methods and Design Considerations

7.1 Channel Mapping

Figure 7.1 shows the channel type mapping that is used for the configuration of the SS. In layer 2 test cases non default channel mapping can be applied on SS, as explained in clause 4.2.1.

Figure 7.1-1: Channel type mapping for the default configuration of the SS

7.1.1 PDCCH Candidate Selection

In this clause following abbreviations are used:

- Common search Space Aggregation: CS_Agr.
- UE-Specific Search Space Aggregation: UE_Agr.
- Total number of CCEs available in a subframe: Max_CCE.

SS shall apply defined rules below in a DL subframe for PDCCH candidates' selection.

- Scheduled transmissions on SI-RNTI / P-RNTI / RA-RNTI, use Common Search Space. UL and DL Scheduled transmissions on C-RNTI/ SPS C-RNTI, and DL Scheduled transmissions on Temp. C-RNTI, use UE-Specific Search Space. Transmissions on TPC-PUCCH-RNTI / TPC-PUSCH-RNTI and UL Scheduled transmissions on Temp. C-RNTI is not considered for default CCE management.
- If a transmission on SI-RNTI is scheduled, PDCCH candidate corresponding to CCEs between 0 and (CS_Agr-1) is used. For FDD, this PDCCH candidate is reserved for SI-RNTI, and left vacant if no SI-RNTI transmission is scheduled. For TDD the default UL/DL configuration type 1, this PDCCH candidate is reserved for SI-RNTI in subframes 0 & 5 (i.e. subframes where PDCCH for UL grant for C-RNTI/SPS-RNTI is not scheduled).

- PDCCH candidates corresponding to CCEs between CS_Agr and (2*CS_Agr-1) can be used either for the transmission on P-RNTI or RA-RNTI. In conformance test cases with single UE, there is no requirement for transmissions scheduled for both P-RNTI and RA-RNTI in one DL subframe.

For FDD:

- For DL transmission for C-RNTI/SPS-RNTI/Temp C-RNTI the lowest value of m =m' which has a PDCCH available from CCEs between 2*CS_Agr and (Max_CCE-1) shall be used. 'm' is defined in TS 36.213 [30], clause 9.1.1.
- For UL transmission for C-RNTI/SPS-RNTI the lowest value of m = m">m" which has a PDCCH available from CCEs between 2*CS_Agr and (Max_CCE-1) shall be used, irrespective of PDCCH candidate corresponding to m' is used or not.

For TDD:

- For DL transmission, for C-RNTI/SPS-RNTI/Temp C-RNTI the lowest value of m =m' which has a PDCCH available from CCEs between 2*CS_Agr and (Max_CCE-1) shall be used. 'm' is defined in TS 36.213 [30] clause 9.1.1.
- For UL transmission, for C-RNTI/SPS-RNTI the lowest value of m = m">m' which has a PDCCH available from CCEs between 2*CS_Agr and (Max_CCE-1) shall be used, irrespective of PDCCH candidate corresponding to m' is used or not.

NOTE: If m' or m'' cannot be allocated in any TTI, it is a TTCN error due to X-RNTI not properly allocated. The error shall be reported to TTCN. The TTCN will exit the test case assigning an inconclusive verdict.

7.1.1.1 FDD candidates selection

Table 7.1.1.1-1 gives the CCE resources utilized for m' and m" for default values of common search space aggregation level =4, UE-specific search space aggregation L=2 resulting in 6 PDCCH candidates m=0..5 and channel Bandwidth of 5 MHz. This give Max_CCE =20 for FDD. The table also gives the corresponding CCE start indices of PDCCH candidates for m' and m".

Table 7.1.1.1-1: CCE Start indices(m' & m" to be used for various C-RNTIs (5 MHz)

Tables 7.1.1.1-2, 7.1.1.1-3 and 7.1.1.1-4 give the CCE resources utilized for m' and m" for default values of common search space aggregation level =4, UE-specific search space aggregation L=2 resulting in 6 PDCCH candidates m=0..5 and bandwidths of 10/15/20 MHz respectively. This gives Max_CCE =25(10 MHz)/37(15 MHz)/50(20 MHz) for FDD. The tables also give the corresponding CCE start indices of PDCCH candidates for m' and m". These are in general to be applied in MAC Transport block size test cases defined in clause 7.1.7 of TS 36.523-1 [1].

7.1.1.2 TDD candidates selection

The default TDD subframe configuration 1 is applied to this clause.

Considering that each TDD subframe having different PHICH group number, and only two symbols being present for PDCCH in the special subframes 1 and 6 for bandwidth of 5 MHz, two symbols for PDCCH in all subframes for bandwidth of 10/15/20 MHz (TS 36.508 [3]), each subframe has, therefore, different number of MAX CCE.

Table 7.1.1.2-1 gives the PDCCH candidates of m' and m" for default values of common search space aggregation level =8, UE-specific search space aggregation L=8 resulting in 2 PDCCH candidates m=0,1 and the corresponding CCE start indices for channel bandwidth of 5MHz. SF0 and SF5 cannot be used for UL grant. SF1 and SF6 are not used for DL assignment. SF2, SF3, SF7 and SF8 are not applicable to PDCCH CCE allocation since they are uplink subframes.

Table 7.1.1.2-1: CCE Start indices (m' & m") to be used for various C-RNTIs (5 MHz)

7.2 Uplink Grant

The Network/SS informs the UE if it is allowed to make Uplink Data transmission by transmitting 'DCI format 0' on PDCCH. The UE shall transmit (4 TTI later for FDD or variable for TDD) a Transport block of exactly the same size as specified in DCI format 0. The UE has no control of its own on TB size, and has to merely follow the network, even if that means lots of MAC padding or resource starving.

The UE has the following means to communicate if it has UL data ready for transmission and subsequently the estimate of quantity of data to be transmitted.

RACH procedure: UE in idle mode, handed over to a new cell or connected mode but PUCCH is unsynchronized (sometimes referred to as PUCCH is not configured) will trigger RACH procedure on data ready for transmission in UL.

Scheduling Request: UE in connected mode, no grant configured, PUCCH is synchronized and has data ready for transmission in UL, will transmit a scheduling request on PUCCH.

Buffer Status Reports: UE in connected mode, PUCCH synchronized, has a configured grant for current TTI, but grant is not sufficient to transmit all the data will include MAC control element BSR in the UL MAC PDU.

RACH and SR indicate on data availability and BSR provides an estimate of data available for transmission.

CQI/PMI/RI feedback from the UE which indicates the channel conditions and recommended number of layers.

Hence to determine the exact need of the grant requirement of the UE a network/SS needs to act on all four of the above. This eventually complicates the SS implementation and hence the grant allocation procedure is simplified such that SS needs only to react on reception of SR and grant allocation configured from the TTCN.

The SS disables aperiodic CQI/PMI/RI feedback from the UE by setting the 'CQI request field' to 0 in DCI format 0/RAR grant.

When request for periodic CQI/PMI/RI feedback is requested due to TTCN configuration, the SS does not react on periodic CQI/PMI/RI feedback received and still allocates grants as configured from TTCN.

The SS, if configured for maintaining PUCCH synchronization at UE, shall periodically transmit automatically MAC PDUs containing the MAC control element 'Timing Advance'. The period as configured by the TTCN is set to 80 % of the 'Time Alignment Timer' default value (750 ms) configured at UE.

Additionally the SS can be configured to automatically transmit a 'configured' UL grant at every reception of a Scheduling Request. This grant should be selected under the following restrictions:

- All UE categories can handle this i.e. (TBS <= 5160).
- It is sufficiently large that most of uplink signalling messages can be transmitted. In case the grant is not sufficient to fit the whole UL data, the UE will have to wait for the expiry of RETX_BSR_TIMER and retransmit a SR. And hence the procedure is repeated.

The following 4 types of grant allocation configurations are possible. Grant allocation Types 1 to 3 are applicable, when the UE is in connected state. Grant allocation Type 4 is applicable when UE is establishing /re-establishing the RRC Connection, or during handover or in connected state but PUCCH is not synchronised.

Grant Allocation Type 1:

- SS is configured to maintain PUCCH Synch.
- SS is configured to send an automatically 'configured Grant' (in terms of I_{MCS} and N_{PRB}) to the UE on every reception of a Scheduling Request, within 10 subframes. The default configured grant is $I_{MCS} = 9$ and $N_{PRB} = 25$, unless explicitly specified in test cases.
- By default this type of grant allocation is applied. The majority of Idle mode, RRC and NAS test cases, the preambles of all tests and the postambles of those tests for which UE is still PUCCH synchronised at the end of test body. A few Layer 2 tests also use this type of grant.

Grant Allocation Type 2:

- Configure SS to maintain PUCCH Synch.
- Configure SS to periodically transmit a grant (I_{MCS} and N_{PRB}). Number of grants (1 or more) and period (in ms) configured by TTCN.
- The first grant transmitted is as specified in the explicit timing information. If timing information is "now" the SS selects the first suitable subframe for UL transmission.
- The grant allocation period for TDD shall be assigned without conflict with the allowed UL subframes in the TDD subframe configurations. As example of allocation period, the TDD UL Grant allocation can be assigned as in multiples of 5 ms.
- This type of grant allocation is applicable to the majority of RLC, PDCP and a few MAC test cases.
- No additional grant is allocated on reception of any SRs.

Grant Allocation Type 3:

- SS may or may not be configured to maintain PUCCH Synch.
- Configure SS to transmit a one time grant (I_{MCS} and N_{PRB}) in the time requested by TTCN. The one time transmission is achieved by setting Number of grants=1 and period =Only once
- This type of grant allocation is suitable for MAC and DRB tests when UE is in UL Synchronised state

Grant Allocation Type 4 (RACH configuration):

In addition to the 3 types of UL grant allocations, a fourth type of grant allocation during the RACH procedure is also possible, where the SS behaves as per the RACH procedure configured and allocates the configured grant during the RACH procedure. This UL Grant type is used in the configuration for the preamble in many situations, basically in MAC test cases. This type of grant is further used when UE is establishing/re-establishing the RRC connection or during handover, or when the UE is not PUCCH synchronised;

All the UL grant allocation methods define grant allocation in terms of I_{MCS} and N_{PRB} to be used. The SS shall allocate RBs corresponding to PRB indices $0..(N_{PRB}-1)$.

7.2.1 Exception TC list

This clause contains the exception test case list where the explicit uplink grant types other than UL grant type 1 are specified.

Table 7.2.1-1: Exception test case list with explicit uplink grant types other than UL grant type 1

7.3 Downlink Resource Allocation

The DL resource allocation is an SS emulation function. In order to ensure similar DL behaviours (within defined tolerances) on the different SS platforms in the timing stringent requirements, all downlink resource allocation schemes specified in the present clause shall be supported by the SS.

When the DL data is to be sent with a specific scheduling requirement, for instance, in a TTI in advance rather than "now", the TTCN shall ensure that the data is scheduled at least 100 ms in advance. The 100 ms time in general covers all time delays, from the time DL data is sent by the TTCN at the EUTRA PTC to the completion of the transmission at the SS (TTCN delays, codec delays, adaptor delays and SS processing delays at various protocol Layers). In the case of more than one NAS PDU is piggy-backed in a scheduled RRC PDU, 20ms shall be added per additional NAS PDU: 100ms + ((NoOfNASPDUs - 1) * 20ms; this calculation is based on the assumption that there are not more than 7 piggy-backed NAS messages; this is valid for LTE.

NOTE: The DL data means DL signalling and/or data in the present clause.

7.3.1 PDCCH DCI default formats

Two types of DCI combinations are identified as default formats for the signalling and protocol test.

DCI combination 1 uses:

- DCI format 1A, resource allocation type 2 localised, for all DL scheduling types.

DCI combination 2 uses:

- DCI format 1C, resource allocation type 2 distributed, for scheduling of PCCH/BCCH/RAR; and
- DCI format 1 resource allocation type 0, for UE dedicated scheduling.

7.3.1.1 Default DCI Format to be used in test cases configuring MIMO

Transmission mode 3 will be used in MIMO test cases configuring 2 Transmit antenna SS environment. As per 36.213 Table 7.1-5, in Transmission mode 3, UE is expected to decode only DCI formats 2A and 1A. Similarly for Transmission mode 4, UE is expected to decode only DCI formats 2 and 1A. Hence for all test cases configuring 2TX (2 antenna ports) at SS, DCI combination 1 is the default DCI combination to be applied. This allows DCI format 1A to be used as default DL scheduling scheme for test sequences not explicitly specified to use DCI formats 2A or 2(i.e. preamble, postamble etc.)

7.3.2 Radio parameters configured

The SS shall support DL QPSK, 16QAM and 64QAM modulation schemes. The configured radio parameters, including DCI format, resource allocation types, maximum allowed modulation scheme, first virtual / physical resource block to be used, maximum available resource blocks and redundancy version, are provided to the SS.

In the normal signalling test condition, DL RLC and HARQ retransmissions are rare. The redundancy version is provided to allow the occasional HARQ retransmissions. For those MAC, RLC tests contained in table 7.3.2-1 where timing requirements are involved the DL or UL HARQ retransmissions are not tolerable. Table 7.3.2-2 lists the RLC tests where timing requirements are involved, only one DL or UL HARQ retransmission per transport block is tolerable. Unless otherwise specified, if HARQ retransmissions occur in the test cases contained in table 7.3.2-1 or more than one HARQ retransmission occurs in the test cases of table 7.3.2-2, the test cases will be terminated with verdict inconclusive.

NOTE: If the test is expecting the reporting of UL ACK/NACK for the DL MAC PDUs, or is configuring the PHICH in a certain mode, HARQ retransmissions other than those that are already specified in the prose will have an impact on the test sequence. If test cases perform scheduling of data transmissions and/or receptions, or the testing timers in the test cases are less than 900 ms (i.e. the tolerance for 90 ms), HARQ retransmissions will make it difficult to continue testing.

Table 7.3.2-1: TC list intolerable of HARQ retransmissions

Test case	Comment				
	MAC				
7.1.3.1, 7.1.3.2, 7.1.3.4, 7.1.3.5, 7.1.3.6, 7.1.3.9, 7.1.6.1, 7.1.6.2	HARQ feedback reporting enabled or DL CRC errors introduced; DL HARQ un specified (re)transmissions will result in 'Fail' in test body, UL HARQ retransmissions are allowed;				
7.1.4.8	Strict relationship between grant and UL data				
7.1.4.3	Up to 104 PDUs to be sent in DL every TTI;				
7.1.4.2, 7.1.4.11, 7.1.4.12, 7.1.4.14, 7.1.5.4	HARQ feedback transmission specified or PHICH errors introduced				
7.1.4.15, 7.1.4.16	Periodic UL grants				
	RLC				
7.2.2.6, 7.2.2.7, 7.2.2.8, 7.2.2.10, 7.2.3.1, 7.2.3.2, 7.2.3.4, 7.2.3.5, 7.2.3.10, 7.2.3.13, 7.2.3.14, 7.2.3.15, 7.2.3.18	Tolerating HARQ retransmissions is not feasible due to rigid timing and scheduling conditions. Testing timer < 900 ms				

Table 7.3.2-2: TC list intolerable of more than one HARQ retransmission per transport block

Test case	Comment
F	RLC
7.2.3.6, 7.2.3.7, 7.2.3.8, 7.2.3.9, 7.2.3.17	Tolerating more than one HARQ retransmission is not feasible due to rigid timing and scheduling conditions. Testing timer < 900 ms

7.3.2.1 HARQ Retransmission when MIMO is configured

For test cases configuring MIMO, if in a TTI more than one transport blocks are scheduled (DCI format 2/2A/2B), the HARQ retransmission is handled independently for each transport block by SS. In case UE ACKs one Transport block and NACKs the other and there is no fresh data scheduled for transmission, SS only schedules the NACKed transport block for retransmission, using same I_{mcs} as used in initial transmission, mapped to codeword 0. Acked Transport block (and hence codeword 1) is disabled by setting corresponding $I_{MCS} = 0$ and $rv_{idx} = 1$. Resource allocation (Nprb) used in retransmission is same as in initial transmission.

It is assumed that retransmission and fresh data scheduled in one TTI will not happen.

7.3.3 General DL scheduling scheme

The rules in the present clause, unless particularly specified, are applied to both default DCI combinations.

The bandwidth of 5/10/20 MHz makes 25/50/100 available physical resource blocks respectively. The 25/50/100 resource blocks are divided into three distinct sets. Exact set sizes and the elements contained in the individual sets depend upon the DCI combination to be applied.

- The first set is reserved for BCCH mapped to DL-SCH (SI-RNTI).
- The second set is reserved for PCCH mapped to DL-SCH (P-RNTI).
- The third set is used for one of mutually exclusive transmissions of:
 - 'Random Access Response' mapped to DL-SCH (RA-RNTI); or
 - UE-dedicated scheduling mapped to DL-SCH (C-RNTI/ SPS C-RNTI/ Temp C-RNTI).

For each subframe for which data of one or more types is scheduled, the SS shall select a Transport Block Size (TBS), independently for each type of data scheduled, such that:

- All the scheduled data is transmitted respecting the timing information. More details on the timing information can be found in clause 7.8.
- Not more than MaxRbCnt resource blocks are used, for DCI format 1C, N_{PRB} = MaxRbCnt.
- Minimum MAC Padding is performed.
- If all scheduled Data cannot be transmitted in the indicated subframe, for example due to TDD and half duplex configuration, it shall be transmitted in the next available subframe.

7.3.3.1 Additional rules for BCCH scheduling scheme

This scheme is applicable for Data transmission on logical channel BCCH mapped to DL-SCH, PDCCH scrambled by SI-RNTI. For both DCI combinations 4 physical resource blocks are reserved for BCCH transmission. The maximum modulation scheme is restricted to QPSK.

Following additional rules are applied for TBS selection:

- The Max TBS, the maximum TBS allowed for the scheduling scheme, is restricted to 600. (nearest value achievable for $I_{TBS} = 9$ and $N_{PRB} = 4$, as per table 7.1.7.2.1-1 of TS 36.213 [30]).

- If the scheduled Data cannot fit into a TBS smaller or equal to Max TBS, SS generates an error (it's a TTCN error). TTCN should gracefully exit the test case as a fatal error, assigning inconclusive verdict.
- Rules in clause 7.3.3.1.1 for DCI combination 1 and in clause 7.3.3.1.2 for DCI combination 2 shall be applied.

7.3.3.1.1 BCCH with DCI combination 1

TS 36.213 [30], table 7.1.7.2.1-1, rows with I_{TBS} =0..26 and columns with N_{PRB} =2 (corresponding to TPC LSB =0) and N_{PRB} =3 (corresponding to TPC LSB =1), TBS <=Max TBS are applicable.

Distinct TBSs and all (TPC LSB, I_{TBS}) combinations for each distinct TBS are listed in the sheet.

If a TBS can have two (TPC LSB, I_{TBS}) combinations, the combination with TPC LSB =0 is selected.

RIV indicates 4 PRBs with index 0..3 allocated.

7.3.3.1.2 BCCH with DCI combination 2

TS 36.213 [30], table 7.1.7.2.3-1, $I_{TBS} = 0..17$ with TBS \leq Max TBS are applicable.

RIV indicates 4 virtual RBs with index 0..3 allocated. These virtual RBs correspond to the physical RBs

- with index 0, 6, 12, 18 in even slots and 12, 18, 0, 6 in odd slots for 5 MHz bandwidth;
- with index 0, 12, 27, 39 in even slots and 27, 39, 0, 12 in odd slots for 10 MHz bandwidth;
- with index 0, 24, 48, 72 in even slots and 48, 72, 0, 24 in odd slots for 20 MHz bandwidth.

7.3.3.2 Additional rules for PCCH specific scheduling scheme

This scheme is applicable for Data transmission on logical channel PCCH mapped to DL-SCH, PDCCH scrambled by P-RNTI. For DCI combination 1, one physical resource block is reserved. For DCI combination 2, two physical resource blocks are reserved for 5 MHz bandwidth, and four physical resource blocks are reserved for 10 MHz or 20 MHz bandwidth. The maximum modulation scheme is restricted to QPSK.

Following additional rules are applied for TBS selection:

- If the scheduled Data cannot fit into Max TBS, SS generates an error (it's a TTCN error). TTCN should gracefully exit the test case as a fatal error, assigning inconclusive verdict.
- Rules in clause 7.3.3.2.1 for DCI combination 1 and clause 7.3.3.2.2 for DCI combination 2 shall be applied.

7.3.3.2.1 PCCH with DCI combination 1

TS 36.213 [30], table 7.1.7.2.1-1, rows with I_{TBS} =0..26 and columns with N_{PRB} =2 (corresponding to TPC LSB =0) and N_{PRB} =3 (corresponding to TPC LSB =1) TBS <=Max TBS are applicable.

The Max TBS is restricted to 120 (nearest value achievable for $I_{TBS} = 9$ and $N_{PRB} = 1$, as per table 7.1.7.2.1-1 of TS 36.213 [30]).

Distinct TBSs and all (TPC LSB, I_{TRS}) combinations for each distinct TBS are listed in the sheet.

If a TBS can have two (TPC LSB, I_{TBS}) combinations, the combination with TPC LSB =0 is selected.

RIV indicates 1 PRBs with index 4 allocated.

7.3.3.2.2 PCCH with DCI combination 2

TS 36.213 [30], table 7.1.7.2.3-1, I_{TBS} =0..11 for 5 MHz/ I_{TBS} =0..17 for 10 or 20 MHz with TBS \leq Max TBS are applicable.

The Max TBS is restricted to

296 bits (nearest value achievable for $I_{TBS} = 9$ and $N_{PRB} = 2$) for 5 MHz bandwidth,

600 bits (nearest value achievable for $I_{TRS} = 9$ and $N_{PRB} = 4$) for 10 or 20 MHz bandwidth.

RIV indicates either two virtual RBs with index 4 and 5 allocated, or four virtual RBs with index 4 to 7 allocated. These virtual RBs correspond to physical RBs:

with index 1 and 7 in even slots and 13 and 19 in odd slots for 5 MHz bandwidth;

with index 1, 13, 28, 40 in even slots and 28, 40, 1, 13in odd slots for 10 MHz bandwidth;

with index 1, 25, 49, 73 in even slots and 49, 73, 1, 25 in odd slots for 20 MHz bandwidth.

7.3.3.3 Additional rules for RAR specific scheduling scheme

This scheme is applicable for transmission of Random Access Response mapped to DL-SCH, PDCCH scrambled by RA-RNTI. For both DCI combinations four physical resource blocks are reserved. The maximum modulation scheme is restricted to QPSK.

Following additional rules are applied for TBS selection:

- The Max TBS is restricted to 600 bits (nearest value achievable for $I_{TBS} = 9$ and $N_{PRB} = 4$, as per table 7.1.7.2.1-1 of TS 36.213 [30]).
- If the scheduled Data cannot fit into Max TBS, SS generates an error (it's a TTCN error). TTCN should gracefully exit the test case as a fatal error, assigning inconclusive verdict.
- Rules in clause 7.3.3.3.1 for DCI combination 1 and clause 7.3.3.3.2 for DCI combination 2 shall be applied.

7.3.3.3.1 RAR with DCI combination 1

TS 36.213 [30], table 7.1.7.2.1-1, rows with $I_{TBS} = 0..26$ and columns with $N_{PRB} = 2$ (corresponding to TPC LSB = 0) and 3 (corresponding to TPC LSB = 1) TBS \leq Max TBS are applicable

Distinct TBSs and all (TPC LSB, I_{TBS}) combinations for each distinct TBS are listed in the sheet.

If a TBS can have two (TPC LSB, I_{TBS}) combinations, the combination with TPC LSB = 0 is selected.

RIV indicates 4 PRBs with index 5..8 allocated.

7.3.3.3.2 RAR with DCI combination 2

TS 36.213 [30], table 7.1.7.2.3-1, $I_{TBS} = 0..17$ with TBS <= Max TBS are applicable.

RIV indicates 4 virtual RBs are allocated. These corresponds to physical RB

with index 13, 19, 2, 8 in even slots and 1, 7, 14, 20 in odd slots for 5 MHz bandwidth;

with index 2, 14, 29, 41 in even slots and 29, 41, 2, 14 in odd slots for 10 MHz bandwidth;

with index 2, 26, 50, 74 in even slots and 50, 74, 2, 26 in odd slots for 20 MHz bandwidth.

7.3.3.4 Additional rules for UE-dedicated scheduling scheme in normal mode

The UE-dedicated DL scheduling can work in the normal mode or in the explicit mode. The two resource allocation schemes shall be reconfigurable from each other when the UE and SS are not sending and receiving data, for instance, at end of the test preamble and before the beginning of the test body.

The present clause is specified for the use of the normal mode. The explicit mode is referred to clause 7.3.3.6.

The scheme specified in the present clause is applicable for transmission of data dedicated to a UE in a DL subframe, mapped to DL-SCH, PDCCH scrambled by C-RNTI/ SPS C-RNTI/ Temp C-RNTI when spatial multiplexing MIMO mode is not configured. The maximum modulation scheme is restricted to 64QAM. For the DCI combination 1, 20 physical resource blocks (5 to 24), and for the DCI combination 2, 17 physical resource blocks are reserved. In the case when three intra frequency cells are applied to the test in the DCI combination 1, for the purpose of interference reduction, only 9 PRBs (16 to 24) are reserved.

In TDD normal TBS selection mode, no data is transmitted in DwPTS of the special subframe. For FDD, data can be transmitted in any subframe.

The following additional rules are applied for TBS selection:

- Multiple ASPs can also carry same explicit timing information; indicating different ASP payloads, eventually needs to be transmitted in 1 TTI.
- The Max TBS is restricted to 10296 bits (Max supported by UE category type 1).

For 5 MHz bandwidth and the DCI combination 1 with 20 PRBs or DCI combination 2, the TBS 8248, 8760, and 9528 are blocked as they result in coding rates higher than 0.93.

For 5 MHz bandwidth and special DCI combination 1 with 9 PRBs, the TBS 2216, 5992 and 6712 are blocked as they result in coding rates higher than 0.93.

For 10 MHz and 20 MHz bandwidths none of TBSs are blocked as no TBS combination result in coding rates higher than 0.93.

The blocked TBS are considered to be not available for selection.

- Data pending for transmission in a given sub-frame consists of (listed in transmission priority order):
 - MAC Control Elements that the SS needs to send.
 - AMD STATUS PDU(s) that the SS needs to send.
 - Data not sent in previous subframe(s).
 - Fresh Data scheduled for transmission in this subframe for all logical channels.
- Distinct TBSs and all (N_{PRB}, I_{TBS}) combinations for each distinct TBS are listed in the sheet.
- If a TBS size can be achieved with more than one combination of $I_{MCS}(I_{TBS})$ and N_{PRB} :
 - Select combination with lowest delta between $N_{\rm PRB}$ and $I_{\rm MCS}$.
 - If still more than one combination remain, select combination with highest N_{PRB} .
- Not more than one RLC Data PDU shall be placed in a MAC PDU per logical channel (i.e. minimize RLC segmentation).
- In a subframe, in case there is data pending for transmission from more than one logical channel, for each type of data pending for transmission as defined above, priority shall be given to the logical channel with the lowest logical channel priority value. In case of more than one logical channel with the same logical channel priority value, these logical channels should be served equally. Data pending for transmission from more than one logical channel will rarely happen for the signalling and protocol test.
- Data not transmitted within a subframe is scheduled as pending for transmission in the next available subframe
 according to the priorities given above. Pending data for transmission will rarely happen for the signalling and
 protocol test.
- TBS selected in a context by various platforms shall be within an allowed deterministic tolerance of:
 - 2 bytes for potential Timing Advance Command MAC Control Element (1 byte data + 1 byte MAC sub header).
 - 4 bytes each for AMD STATUS PDU (2 bytes data + 2 bytes MAC subheader).

- Therefore in the worst case the SS may add up to (2 + 4 x N_{AMRB}) bytes to the data scheduled for transmission in a certain subframe, where N_{AMRB} is the number of AM radio bearers (SRB or DRB) actively sending DL data in the test, in any subframe.
- For DCI combination 1 RIV is calculated based on physical resource blocks corresponding to N_{PRB} of the selected TBS and (N_{PRB}, I_{TBS}) combination. The physical resource blocks that can be allocated are the first N_{PRB} resources of index range
 - 5..24 for 5 MHz bandwidth,
 - 28..49 for 10 MHz bandwidth,
 - 9..30 for 20 MHz bandwidth. Also in preamble/postamble phase of MAC TBS test cases with 15 MHz bandwidth configured.
- For DCI combination 2, RBG assignment is calculated based on physical resource blocks corresponding to N_{PRB} of the selected TBS and (N_{PRB} , I_{TBS}) combination. The size of RBG is 2 for 5 MHz, 3 for 10 MHz and 4 for 20 MHz. The available physical resource blocks for allocation are:
 - For 5 MHz bandwidth, RBG1(2,3), RBG2(4,5), RBG4(8,9), RBG5(10,11), RBG7(14,15), RBG8(16,17), RBG10(20,21), RBG11(22,23) and RBG12(24). If N_{PRB} is even, the first N_{PRB} /2 available RBGs are allocated. If N_{PRB} is odd, then first (N_{PRB} -1)/2 RBGs and RBG 12 are allocated.
 - For 10 MHz bandwidth, RBG1(3,4,5), RBG2(6,7,8), RBG3(9,10,11), RBG5(15,16,17), RBG6(18,19,20), RBG10(30,31,32), RBG11(33,34,35), RBG12(36,37,38) and RBG16(48,49). If N_{PRB} mod 3 is 0, the first N_{PRB} /3 RBGs are allocated. If mod 3 is 2, then first (N_{PRB} -2)/3 available RBGs and RBG 16 are allocated.
 - For 20 MHz bandwidth, RBG1(4,5,6,7), RBG2(8,9,10,11), RBG3(12,13,14,15), RBG4(16,17,18,19), RBG5(20,21,22,23), RBG7(28,29,30,31), RBG8(32,33,34,35), RBG9(36,37,38,39), RBG10(40,41,42,43), RBG14(56,57,58,59), RBG15(60,61,62,63), RBG16(64,65,66,67), RBG17(68,69,70,71), RBG19(76.77.78.79) and RBG20(80,81,82,83). The first $N_{\rm PRB}$ /4 RBGs are allocated.

7.3.3.6 UE-dedicated scheduling scheme in explicit mode

This scheme applies to:

1. spatial multiplexing MIMO configurations or

2. *transmit diversity MIMO configurations* and non-MIMO configuration where the normal mode scheduling scheme is inappropriate.

SS is configured with an exact TBS (modulation and coding scheme, I_{mcs} , and number of resource blocks, N_{prb}) to use. Other parameters, such as the HARQ process number and redundancy version to use for each transmission, are also configured by the TTCN. SS shall use TBS sheets with matching DCI format and Resource allocation Type. If the parameter 'FirstRbIndex' is configured different than specified in respective TBS sheet, the resource block bit maps in TBS sheet s are shifted by 'FirstRbIndex' and applied, with an exception for Resource allocation type 0 where only the full size 'Resource block groups' are shifted by 'FirstRbIndex'; if the last Resource block group is not full size, and is part of resource block bitmap, it is applied without any shift.

All data scheduled for a certain subframe shall be transmitted in the single indicated subframe, using configured parameters. The TTCN shall ensure that the configured parameters are consistent, in particular that the scheduled data size and the configured TBS match each other. Data scheduled by the prose, and hence also by the TTCN, provides possible space for the Timing Advance MAC control element and the RLC Status PDU. The SS shall include one of these if so triggered, else the bits reserved for these are filled by MAC padding.

Additionally, in the case of MIMO data scheduled for transmission in a given sub-frame, this consists of (listed in transmission priority order):

- MAC Control Elements that the SS needs to send (if triggered).
- AMD STATUS PDU(s) that the SS needs to send (if triggered).
- Fresh data scheduled for transmission in this subframe for one or more logical channels, as per logical channel priority [lower value = higher priority]; if data is available for more than one logical channel with the same priority, then the logical channel corresponding to the DRB-ID with the lower value has the higher priority.
- MAC padding.

The following additional rules need to be applied on data scheduled for transmission to be mapped on two transport blocks corresponding to two code words:

- Higher priority data (as stated above) maps on to Transport Block 1 and lower priority data maps on Transport Block 2 (if Transport Block 1 gets full); and
- Minimum MAC padding is performed in Transport Block 1; and
- If data from one logical channel needs to be mapped on to two transport blocks, the PDCP PDUs with lower PDCP sequence numbers get mapped on to Transport Block 1.

7.3.3.6.1 DL Scheduling in Transport Block Size Selection Test Cases

The MAC transport block size selection test cases defined in clause 7.1.7 of TS 36.523-1 [1], use bandwidths of 10/15/20MHz. For the preamble and post amble in these tests, the default scheduling rules defined in clauses 7.3.3.1 to 7.3.3.4 for 10/10/20 MHz and DCI combination 1A are applied respectively. During the test body, when the actual TB sizes with appropriate DCI and resource allocation formats needed are to be tested, the SS is configured in explicit mode for UE-dedicated scheduling.

7.3.3.7 Resource allocation sheets

Attached with this Technical Specification, the DL resource allocation tables can be found, providing physical resource allocations for various transport block sizes, developed as per rules specified in clause 7.3.3, in Microsoft Excel format. Each individual sheet in the workbook represents various scheduling schemes as per table 7.3.3.7-1.

Table 7.3.3.7-1: DL resource allocation sheets

S. No	Sheet Name	Description
1		DL Resource scheduling for DCI format 1A and PDCCH is

24	DCI-2A-RA1-ExplicitConfig	DL Resource scheduling for DCI format 2A, Resource allocation 1
		and PDCCH is scrambled by C-RNTI

7.4 Cell Configurations

7.4.1 Cell Configuration Types

Three cell configurations are defined in TS 36.508 [3] clause 6.3.3: Full Cell, Minimum Uplink Cell and Broadcast Only Cell; however the TTCN always considers all cells as Full Cells, and thus always provides the complete cell configuration parameters.

The SS may:

- always configure a cell as a 'Full Cell' based on the complete information; or
- configure the cell based on the 'CellConfig_Type' flag taking only the required configuration parameters and ignoring the others.

For a given value of the 'CellConfig_Type' flag, the TTCN shall:

- For Full Cell Configuration:
 - expect normal SS behaviour.
- For Minimum Uplink Cell Configuration:
 - Configure the SS to report Preamble detection.
 - Assign verdicts based on the PRACH Preamble Indications.
 - Consume any uplink SRB0 messages (if the SS is configured as a Full Cell).
- For Broadcast Only Cell Configuration:
 - Not configure the SS to report Preamble detection.
 - Consume any uplink SRB0 messages (if the SS is configured as a Full Cell).

7.4.2 Cell Power Change

To set and adjust the cell power at the two test ports, Reference Power and Attenuation, are provided in the record Reference Power.

The field Reference Power is only set when the cell is created and is not updated during the test case execution. The SS applies the Reference Power when the cell is fully configured.

To adjust the power level in the test case, the field Attenuation is used. After initial configuration of a cell the attenuation corresponds to the value "off". When the power is changed for more than one cell, the power changes must happen at the same time for all the cells according to the time instances for power level changes specified in TS 36.523-1 [1]. The time it takes to complete the power change for all the cells shall be done:

- within a maximum of 700 ms when changing the power of a cell from "off" to a certain value; or
- within a maximum of 100 ms (10 frames) otherwise.

When adjusting the power level in the test case, separate templates will be used in order to improve code readability.

The SS shall ensure the power level at the test ports conform to the required downlink signal levels specified in clause 6.2.2.1 of TS 36.508 [3].

7.4.3 E-UTRAN cell identity

7.4.3.1 Timing parameters of cells

For RRC and Idle mode test, the timing parameters in table 7.4.3.1-1 are applied. The specification of Cell 1 - Cell 30 can be found in TS 36.508 [3].

Table 7.4.3.1-1: Timing parameters of simulated cells

Cell M	471	122880	307	122880
NOTE: For T	DD, synchro	nous Tcell val	ues are applied unles	s specified otherwise in
the te	est cases.			

Figure 7.4.3.1-1 illustrates shifting DL transmission timing offset by Tcell = 1 subframe, between multiple NAS FDD cells on the same frequency (table 7.4.3.1-2) in the same PLMN.

Figure 7.4.3.1-1: Timing offset between FDD cells on the same frequency

Figure 7.4.3.1-2 illustrates shifting DL transmission timing offset for three TDD cells operated on the same frequency (table 7.4.3.1-1) in the same PLMN.

Timing shift between synchronous Cell 0 and Cell 1: Tcell = 154 Ts (5 μ s)

Timing shift between synchronous Cell 0 and Cell 2: Tcell = 307 Ts (10 μ s)

Table 7.4.3.1-2 is applied to the NAS test when all NAS cells in a test case belong to the same PLMN. Further cell parameters can be found in TS 36.508 [3], table 6.3.2.2-2.

Table 7.4.3.1-2: Timing parameters of simulated cells for NAS TCs in same PLMN

cell ID	SFN offset	FDD Tcell (Ts)	TDD To	ell (Ts)
			Synchronous	Non synchronous
Cell A	0	0	0	0
Cell B	124	30720	154	30720
Cell C	257	150897	77	150897
Cell D	1000	61440	307	61440
Cell E	NA	NA	NA	NA
Cell F	NA	NA	NA	NA
Cell G	NA	NA	NA	NA
Cell H	NA	NA	NA	NA
Cell I	NA	NA	NA	NA
Cell J	NA	NA	NA	NA
Cell K	NA	NA	NA	NA
Cell L	NA	NA	NA	NA
Cell M	471	31244	154	31244
NOTE: For TDD), synchronous Tce	I values are applied	unless specified ot	herwise in the test

cases.

Shifting radio frame transmission timing can eliminate the following interference between intra frequency cells:

- P-SS/S-SS to P-SS/S-SS, RS, PBCH, PCFICH, PDCCH and PHICH.
- PBCH to PBCH.
- PBCH to PCFICH, PDCCH and PHICH.
- PDSCH to PCFICH, PDCCH, PHICH.

As TDD UL and DL are on same frequency, to avoid interference between DL and UL, the Random Access Response Timing Advance (RAR TA) is related to the Tcell:

For TDD cells

RAR TA = FLOOR ((Tcell) mod 30720 / 16)

For FDD, the Random Access Response Timing Advance is set to 0.

7.4.4 Cell configurations for NAS test cases

The default cell identifiers for NAS cells are defined in 36.508[3] clause 6.3.2.2.

The allocation of Physical layer cell identifiers to the individual cells is according to (PCI mode 6) being differential for the cells working on the same radio frequency. The way of PCI allocation can reduce the interference between the intrafrequency cells for reference signal to reference signal, PCFICH to PCFICH and PHICH to PHICH. The definition of Cell A - Cell M can be found in TS 36.508 [3].

7.4.5 Configuration of Multi-Cell Environment

When there is more than one EUTRA cell in a test case the following rules are applied in TTCN:

- At the beginning of the preamble, before initial attachment of the UE, all EUTRA cells are configured but switched off.
- In the preamble only the serving cell is switched on; all other cells remain switched off.

- At the end of the preamble the cells are configured according to the initial power level settings (T0) of the test case.

The mapping of cells to physical resources and management of the physical resources are out of TTCN scope. The following principles can be applied to the system simulator:

- Cells being switched off need not to be mapped to physical resources.
- When a cell is switched off mapping to a physical resource may be kept and reused when the cell is switched on again.
- When a cell is switched on it can either already been mapped to a physical resource or it needs to be mapped to a free resource.
- When there are less physical resources than cells it is up to SS implementation to find strategies to dynamically map the cells to the resources.

Independent from the strategies being used the system simulator shall obey timing restrictions for changing power-levels of one or several cells as stated in clause 7.4.2.

7.5 TDD Considerations

LTE options of FDD and TDD will be contained in the same common FDD and TDD test cases, similar to the prose in TS 36.523-1 [1].

The TDD Uplink-downlink configuration 1 in 3GPP TS 36.211 [35], table 4.2-2 is applied.

7.5.1 FDD vs. TDD implementation

FDD/TDD differences are introduced in the common FDD and TDD test cases using branches at a low level in the test case. The branches are used either:

- to assign a variable;
- to implement a different behaviour;
- to change an FDD or TDD parameter in a template sent to the UE or SS.

The mode under test (FDD or TDD) is based on the value of the bands under test.

7.5.2 Guideline for FDD vs. TDD verification

With respect to EUTRA FDD vs. TDD technologies, it is recommended that separate verifications for FDD and TDD are required for the TCs in TS 36.523-1 [1]:

- clause 6, 7, 8, 12, 13;
- with MultiRAT involved.

7.6 Special RLC Modes

7.6.1 Suppression of RLC Acknowledgements

Two different modes, both applicable per radio bearer, are defined as:

- General suppression:
 - If this mode is activated, no RLC acknowledgements will be generated by the SS. This mode can be switched on and will persist until it is switched off. Afterwards the SS will continue handling the RLC acknowledgements as normal.
- One time suppression:

- If this mode is activated, no RLC acknowledgement will be generated by SS for the next RLC message data PDU received. Once this has been done, the SS continues handling RLC acknowledgements as normal.

In case of a handover the modes continue to be active.

7.6.2 Modification of VT(S)

This mode allows to manipulate the RLC state variable VT(S) so that the SS can generate an RLC sequence number as needed during a test. The input to the special test mode is an integer (0..1023) as value of ModifyVTS, The SS shall set variable VT(S) as follows:

$$VT(S) := ModifyVTS.$$

The purpose of this special test mode is to force an incorrect RLC sequence number to be used by the SS. Once VT(S) has been modified in the RLC entity at the SS side, this RLC entity will be inconsistent. One possibility to bring the RLC entity back to normal is to re-establish the RLC peer connection. This is done in the only use case of this special RLC test mode by performing an RRC Connection reconfiguration immediately after the test mode has been applied.

Users of this test mode should ensure that the RLC AM PDU carrying the incorrect sequence number will reach the peer RLC entity. It is therefore recommended to activate the RRC Connection reconfiguration only after some delay. This delay shall be short enough to ensure that the UE will not yet request the retransmission of the RLC PDU corresponding to the skipped sequence numbers.

7.7 System information

7.7.1 System information broadcasting

The rules for the transmission of BCCH messages are specified in TS 36.331 [19], clause 5.2. The current clause provides the implementation guidelines.

The ASPs SYSTEM_CTRL_REQ and SYSTEM_CTRL_CNF are used as interface to SS; the following rules apply:

- The complete system information is provided to SS by using a single ASP.
- SS starts scheduling all system information from the same SFN.
- The scheduling information sent to SS is the same as the scheduling information sent to the UE. For each SI message, the subframeOffset in SYSTEM_CTRL_REQ indicates the exact point in time in the SI window at which SS shall start the transmission of the related SI.
- SS shall set the systemFrameNumber in the MIB to the 8 most significant bits of the SFN. A dummy value is provided by TTCN.
- The system information is sent to SS using the asn.1 types, SS shall encode in unaligned PER and add the necessary padding bits as specified in TS 36.331 [19], clause 9.1.1.1.
- In the E-UTRAN-CDMA2000 Inter RAT configuration, SS shall set the CDMA2000 synchronousSystemTime in SystemInformationBlockType8 to the SFN boundary at or after the ending boundary of the SI-window in which SystemInformationBlockType8 is transmitted (see TS 36.331 [19], clause 6.3.4). The changes of synchronousSystemTime will not result in system information change notification, nor in a modification of systemInfoValueTag in SIB1 in TTCN as specified in TS 36.331 [19], clause 6.3.1.

7.7.2 Scheduling information

The maximum number of resource blocks as defined in table 7.7.2-1 are used to broadcast the system information.

Table 7.7.2-1: Maximum number of resource blocks

	Maximum number of resource blocks assigned
SIB1	4
for all SIs	4

The subframe offset values used for SI messages are according to table 7.7.2-2.

Table 7.7.2-2: SubframeOffset values

Scheduling Information No. Acc to TS 36.508 [3], clause 4.4.3.1.2	subframeOffset (FDD)	subframeOffset (TDD)
SI1	1	0
SI2	1	0
SI3	3	15
SI4	7	15
SI5	7	15

All System Information messages are sent only once within the SI-window.

Table 7.7.2-3 (FDD) and 7.7.2-4(TDD) give the SFN's and subframe numbers in which the MIB, SI1, SI2, SI3, SI4 & SI5 are actually scheduled as per default parameters for si-WindowLength(20sf), periodicity for SI1(16), SI2(32), SI3(64), SI4(64) and SI5(64) for bandwidths 5/10/15/20 MHz defined in TS 36.508 [3]:

NOTE: Subframes 4 and 9 are avoided so as to facilitate availability of PDCCHs in the UE specific search space for transmission of PDCCH for both UL C-RNTI/SPS-RNTI and DL C-RNTI/SPS-RNTI/Temp C-RNTI.

7.7.3 System information modification

For system information modification, the same rules as defined in clause 7.7.1 are applied.

The SFN for the start of modification period is calculated by TTCN. The modified system information and the calculated SFN are provided in the ASP SYSTEM_CTRL_REQ.

7.7.3.1 Non-PWS System Information modification

The modification of system information is notified by paging messages containing the systemInfoModification. The paging messages are sent during one modification period before broadcasting the modified system information. The

paging messages are sent on paging occasions (PO) within the paging frames (PF). With the default paging and sysinfo parameters provided in 36.508[3] PO is set to 9 for FDD and 0 for TDD.

7.7.3.1.1 UE in Idle mode

When the UE is in idle mode, the paging frames calculation is based on the UE identity (see to TS 36.304 [14], clause 7). With:

defaultPagingCycle=128

nB=oneT

modificationPeriodCoeff=n4

it results in 4 paging messages to be sent on the paging occasions during the modification period in the frames of:

SFN mod $128 = (UE ID) \mod 128$.

7.7.3.1.2 UE in connected mode

When the UE is in connected mode, paging messages are sent on the paging occasions of each frame within the paging cycle throughout a modification period. This results in 128*4 consecutive paging messages to be sent during the modification period.

Figure 7.7.3.1.2-1: Paging notification UE in connected mode

For ETWS and/or CMAS capable UEs in connected mode, paging messages are sent on the paging occasions of each frame within the last paging cycle of the modification period. This results in 128 consecutive paging messages to be sent during the modification period.

Figure 7.7.3.1.2-2: Paging notification for ETWS and/or CMAS capable UE in connected mode

7.7.3.2 PWS System Information modification

The modification of system information for ETWS and CMAS notification is notified by paging messages. The transmission of system information notification is not necessarily at the beginning of a modification period.

When the UE is in idle mode, the paging frames calculation is the same as defined in clause 7.7.3.1.1.

When the UE is in connected mode, paging messages are sent on the paging occasions of each frame during a paging cycle. This results in 128 consecutive paging messages to be sent. The transmission of the first paging message and the first system information notification are simultaneous and are sent at the beginning of a paging cycle.

7.8 Timers and Timing Restrictions

A timer is set at the beginning of each test case to guard against system failure. Behaviour on expiry of this guard timer shall be consistent for all test cases.

A watchdog timer can be specified for receive statements in order to reduce blocking time when a test case has already failed. Watchdog timers are a kind of TTCN auxiliary timer. When a watchdog timer is used to control a receive event, its expiry does not need to be handled explicitly in the test case, but will lead to a fail or inconclusive verdict due to handling in the default behaviour.

In idle mode operations, an idle mode generic timer is specified for receive statements if the test case specification does not explicitly specify a wait time for the specific test step or test purpose. The expiry of this idle mode generic timer is at least 6 minutes to safely cover most test scenarios.

The watchdog timer and the idle mode generic timer are only to be used inside the test case test body; if the timer expires a fail verdict is applied.

It is the TTCN responsibility to ensure that appropriate timer values are being used.

Tolerances (as described in TS 36.508 [3]) are not applicable to guard timers, idle mode generic timers and watchdog timers.

In general timers of less than 500 ms shall not be implemented by TTCN timers but controlled by usage of the timing information provided by the SS (This is based on an estimate of the system delay). To achieve this, there will be cases when a DL message is scheduled at a specific point in time. This shall be done by adding at least 100 ms to the current time.

If Timing is 'now' the SS shall schedule the data transmission or the (re)configuration in the next available sub-frame, but will ensure that this period is less than 80 ms.

7.8.1 Auxiliary timers

For practical reasons, the TTCN can include timers that are not specified as part of the expected sequence. These timers are documented below.

RLC and PDCP watchdog timer.

7.8.2 RRC timers reconfiguration

Considering the allowed UE accuracy for the RRC timer T3xx being between 100 ms and 2.5 % of T3xx (see TS 36.133 [37]), the TTCN applies the RRC net timers tolerance as MAX (10% of T3xx, (100 ms + 5 RTT)), whereby:

FDD: 10 % of T3xx or 140 ms whichever is higher.

TDD: 10 % of T3xx or 155 ms whichever is higher.

7.8.3 MAC TA timer reconfiguration

Considering that the UE applies new values for MAC timers not before restart of the timer (see TS 36.321 [16], clause 5.8), when the TA timer is changed at the UE, a delay in TTCN will be added so as to allow SS to transmit Timing advance MCE (based on current periodic Timing advance configuration) and hence resulting in restart of TA timer at UE with new value.

7.8.4 Non-protocol timers

Time durations or periods in the test specification without corresponding references in the core specifications are considered as non-protocol timers for which no timer tolerances are applied in the TTCN.

7.9 Error Indication

There are several situations on lower layer in which SS shall raise an error rather than trying to resolve the problem. This is done by sending a SystemIndication. Error to the test case. SS shall raise an error in the following cases:

- HARQ retransmissions (applicable when SS is configured to indicate HARQ retransmissions as errors):
 - HARQ CRC error for UL data;
 - HARQ NACK from the UE unless SS is configured to report HARQ ACK/NACK.
- Paging, System information exceeds max. number of resource blocks.
- Configuration: max. number of resource blocks specified for a channel exceeds system bandwidth.
- When in User-Plane a DL PDCP PDU or SDU not fitting into one TTI is sent with Harq Process being explicitly specified.
- SS gets invalid TimingInfo for TDD from the test case.
- SS detects contradiction of UL grant(s) and TDD configuration.
- Data scheduled for the same TTI does not fit into an available transport block.

Further error conditions are specified in annex D.

7.10 Race Conditions

When two uplink messages are sent from the UE within a very small amount of time, they may be received in either order in the TTCN if they are received on different ports. This may cause a race condition which is due to the snapshot mechanism in TTCN. In these cases, the TTCN will accept the messages in either order and then compare the timestamps of both messages to ensure they were sent in the correct order.

For UL messages received at a single port, there are normally no race conditions, with the exception of the SRB port where the following rules shall be fulfilled, in order to achieve an ordered UL message queue:

- UL messages are queued according to the timing information.
- UL messages with the same timing information are queued according to the logical channel priority with the "higher-first-in" principle.

7.11 Radio Link Failure

A radio link failure shall be triggered by switching the downlink power level of the source cell to the value for non-suitable "Off" for the time period of least T310 + time it takes to receive N310 consecutive out-of-sync indications from lower layers (non-suitable "Off" is defined in TS 36.508 [3], whereas T310 and N310 are defined in TS 36.331 [19]).

If the RRC re-establishment procedure is used in a radio link failure context, it shall be realised by using two cells.

7.12 Test method for RRC signalling latency

Test cases testing RRC signalling latency will need special test method. The PUCCH synchronisation state of UE influences the test method. Following 2 different ways in which the UE's completeness of procedure can be probed are considered:

- 1. UE is still PUCCH synchronized and can respond to uplink grants.
- 2. UE needs a RACH procedure and hence RACH procedural delays add upon the actual procedure delay.

7.12.1 Procedure delays in PUCCH synchronized state

For latency tests there may be up to 4 HARQ retransmissions in DL (corresponding to the default configuration of the SS) but HARQ retransmissions in UL cannot be compensated, i.e. any HARQ error in UL shall result in an inconclusive verdict for the test case (otherwise a UE may get fail due to a HARQ error).

Figure 7.12.1-1 demonstrates the latency check procedure that will be applied when UE is in PUCCH synchronized state and can respond to uplink grants.

SS is configured to report ACK/NACK received from UE, to TTCN.

NOTE: Due to L2 signalling (e.g. RLC STATUS PDUs) it is necessary to limit the reporting of UL HARQ ACK/NACK to the time between sending of the RRC message and receiving the ACK.

By default SS is configured to retransmit any DL MAC PDU max 4 times.

To avoid unexpected side effects the Time Alignment timer needs to be set to infinity and the SS shall be configured to not send any Timing Advance MAC control elements during the latency tests (since this may result in additional ACK/NACK)

The SS shall be configured to report HARQ errors and in the case of an UL HARQ error, an inconclusive verdict is assigned.

In the case of HARQ retransmissions in DL the HARQ RTT Timer according to TS 36.321 clause 7.7 [16] is

- 8 for FDD
- 10 for TDD configuration 1 in case the DL PDU is sent in subframe 4 (as per default; see Table 7.12.1-1).

The SS shall schedule DL retransmission at 4th FDD TTI for FDD or 6th TTI for TDD since reception of the NACK.

Let N be the max allowed delay for procedure.

TTCN schedules at time T1 a DL message to the UE.

TTCN schedules UL grants at

```
\begin{split} &T_2(k) = T_1 + N + \Delta_1 + k * RTT; \\ &\text{with} \\ &k = 0..4; \text{ number of HARQ retransmission in DL} \\ &RTT = 8 \text{ (FDD)} \\ &RTT = 10 \text{ (TDD)} \\ &\Delta_1 = 0 \text{ (FDD)} \\ &\Delta_1 = 0..3 \text{ (TDD; possible UL subframe uncertainty since not all subframes can be used for UL)} \\ &Example: \\ &\text{given TDD; DL PDU sent at subframe 4; N=19} \end{split}
```

 \Rightarrow $\Delta_1 = 1$ since UL grant cannot be scheduled for subframe 3 but needs subframe 4 too

The UL data is sent by the UE at

 $T_3(K) = T_2(K) + 4 + \Delta_2$ with $\Delta_2 = 0$ for FDD and $\Delta_2 = 0..3$ for TDD and K is the value of k corresponding to which a HARQ Ack is received

The latency requirements are fulfilled when

```
T_3(K) - T_1 = N + 4 + \Delta_1 + \Delta_2 + K * RTT
```

Looking at TDD configuration 1 in detail it can be shown that $\Delta = \Delta_1 + \Delta_2 = 0$.. 3

```
\Rightarrow T<sub>3</sub>(K) - T<sub>1</sub> = N + 4 + \Delta + k * RTT; with \Delta = 0 .. 3
```

NOTE:

as long as N is a multiple of 5ms even for TDD configuration 1 we get $\Delta = 0$

Figure 7.12.1-1: Delays in PUCCH synchronized state

Subframe 0 2 3 5 6 8 9 Configuration 1 D S U U D D S U U D Delay from DL to Ack/Nack [TTIs] 6,7 4 6,7 4 Delay from NCK to re tx [TTIs] 4 6 4 6 RTT 11 10 10 11 10 10

Table 7.12.1-1: TDD configuration 1

7.12.2 Procedure delays when RACH procedure required

Figure 7.12.2-1 demonstrates the latency check procedure that will be applied when UE is not PUCCH synchronized state needs RACH procedure.

PRACH configuration index is set as 14 for FDD, 12 for TDD which allows UE to send Preamble in any frame at any subframe.

SS is configured to report ACK/NACK, PRACH preambles received from UE.

By default SS is configured to retransmit any DL MAC PDU max 4 times [1 Transmission and 4 Retransmission].

Let N be the max allowed delay for procedure.

TTCN schedules at time T1, DL message to the UE. This is achieved using Time stamps in send ASP's.

The time difference between the ACK and the reception of PRACH preamble will be checked against N plus any Interruption time (TS 36.133 [37]) and verdict is assigned, when $(Y-X) \le N + T$ interrupt $+ \Delta$:

 $\Delta = 0$ for FDD;

 Δ = 3TTI for TDD, where 3TTI is UL subframe uncertainty.

If cell change occurs, cell timing differences, Frame number offsets need to be included for procedural delay evaluations.

Delay Requirement Y-X<= N + Tinterrupt+?

Figure 7.12.2-1: Delays when RACH procedure needed

7.13 RLC test method for scheduled data

The test loop mode is applied to the RLC tests. The allowed SS delay for sending data (< 80 ms) is comparable to the default values of the RLC timers. In order to ensure a unique TTCN implementation of the RLC test cases and the deterministic test result, independent from the SS platforms and UEs, scheduled data method can be applied to the test.

The scheduled data method is suitable to the RLC test if:

Receiving multiple UL RLC SDUs is expected in the test; the UE may send a STATUS PDU in addition.

Time measurement is required for the looped back RLC SDUs.

DL RLC PDUs are sent on consecutive TTIs; the subframe numbers to be applied are relevant in TDD.

Table 7.13-1 illustrates the data scheduling in the RLC test.

Table 7.13-1: Scheduled RLC test events

Sched	uled timing	t0 (see note 1)	t1 (see note 1)	t2	
Test event	Multiple SDUs	Obtain the	Send DL data	Provide UL grant (see note 2)	
descriptions	Time measurement	reference time	Send DL data	Receive UL data	
	DL data in TDD		Send 1 st DL data	Send subsequent data	
(see note 3)					
NOTE 1: (t1-t0) ≥ 100 ms which is greater than the allowed SS max. delay time, 80 ms.					

NOTE 2: (t2-t1) = 60 ms, this duration will allow the UE transmitting max. 3 scheduling requests (every 20 ms once) after the UL data to be looped back being available at the UE without going onto PRACH.

NOTE 3: The applied TDD subframe numbers 4, 5, 9, 10, 14, 15, 19, 20, 24, 25, ...

If the test case prose does not indicate timely restrictions for the scheduling, sequential sending events are scheduled in consecutive TTIs.

NOTE 1: For TDD configuration 1, the subframes 0, 4, 5 and 9 are considered as consecutive.

NOTE 2: Scheduling may imply to execute the test steps in the TTCN in an order different from the order given in the test case prose. However, the sequence of the events over the air follows the prose description.

7.14 IP packets for Loopback Mode

7.14.1 IP packets used for Loopback Mode A

It is irrelevant which kind of data is used in loopback mode A. Some PDCP test cases however specify to use IP packets. In these cases, an ICMPv4 ECHO REPLY shall be used with a valid IP header checksum and valid ICMP checksum.

7.14.2 IP packets used for Loopback Mode B

According to TS 36.509 [4], the UE performs loopback mode B above the UL TFT entity. Therefore IP packets need to match the packet filters signalled to the UE according to TS 36.508 [3], clause 6.6.2:

When the UE gets configured via NAS signalling with packet filter #1 and #2 according to TS 36.508 clause 6.6.2 the IP packets shall fulfil the following requirements:

Protocol:

UDP referred to packet filter #1 and #2

IP addresses:

Referred to TS 36.508 [3], table 6.6.2-3, note 1 source and destination IP address are the same.

Ports:

packet filter #1 specifies DL filter ⇒ IP packet's source port shall match remote port of packet filter #1.

packet filter #2 specifies UL filter ⇒ IP packet's destination port shall match remote port of packet filter #2.

To summarize, on dedicated bearers for loopback mode B, UDP packets used shall match the packet filters configured at the UE side. The UDP packets, having no specific content, shall have the correct header checksum and UDP checksum. On the default bearer, any other packets can be used, as an example, ICMPv4 ECHO REPLY similar as for loopback mode A.

7.15 Connected Mode DRX

The SS shall support connected mode DRX according to TS 36.321 [16], i.e. the SS shall not send any data to the UE while the UE is not monitoring the PDCCH. To achieve this, the SS needs to estimate the UE's Active Time by considering the on-duration as well as the drx-inactivity timer:

on-duration:

The on-duration can be derived from the SS' DRX configuration.

drx-inactivity timer:

According to TS 36.321 [16], clause 5.7 at the UE the drx-inactivity timer is started or restarted during the Active Time whenever PDCCH indicates a new transmission (DL or UL).

There is no activation time for the configuration of DRX at the UE and it is not acceptable just to consider the on-duration after re-configuration of the UE (for DRX_L according to TS 36.508 [3] the DRX cycle is 1.28 s); instead the drx-inactivity timer needs to be taken in account after DRX reconfiguration as well.

The following rules shall be applied to achieve synchronisation of SS and UE:

- 1. SS shall consider drx-inactivity timer as restarted at the UE whenever the UE is addressed on the PDCCH (DL data or UL grant).
- 2. When there is a scheduling request sent by the UE, SS assigns a grant independent of DRX; when sending out that grant on PDCCH SS considers drx-inactivity timer as (re-)started (as per 1. above).

- 3. For all DL messages scheduled with specific timing information SS shall send the data at the given time irrespective of current DRX configuration.
- 4. DRX (re-)configuration:
 - a) when DRX has not been configured at the UE yet:
 - a1) TTCN will configure the SS just before the sending out the RRCConnectionReconfiguration message configuring DRX at the UE; no other send-events between the reconfiguration of the SS and sending the RRC message shall be scheduled in TTCN.
 - a2) TTCN will schedule sending of the RRCConnectionReconfiguration message configuring DRX with specific timing information.
 - b) Reconfiguration of DRX at the UE: Same as a) but:
 - b1)TTCN shall schedule sending of the RRCConnectionReconfiguration according to the old DRX configuration (i.e. the SS does not need to cache the new configuration).
 - c) RRC connection release:
 - c1) TTCN will release DRX at the SS just after the RRC connection release procedure.
- 5. There shall be no parallel data on any DRBs during DRX reconfiguration.

NOTE: Timing requirements in the DRX test cases:

a) The drx-Inactivity Timer shall be long compared to the duration between sending RRCConnectionReconfiguration and receiving RRCConnectionReconfigurationComplete (> 50 ms). It ensures the SS in-time sending of the RLC STATUS PDU.

or

b) The drx-cycle shall be short compared to the RLC timers applied for SRB1.

Figure 7.15-1 illustrates DRX (re)configuration at the SS and the UE.

Figure 7.15-1: DRX (Re)configuration

NOTE 1: Between RRCConnectionReconfiguration and RRCConnectionReconfigurationComplete the UE may send a separate RLC STATUS PDU to acknowledge the RRCConnectionReconfiguration, but that does not affect the principle as long as SS applies rule 2.

NOTE 2: During the "greyzone" SS does not know about DRX configuration at the UE; during that period according to rule 4a1 and rule 5 there is no data to be sent by SS.

The TTCN (re)configures the connected mode DRX in SS for the test cases if DRX_S is applied (Ref. TS 36.508 [3]. The (re)configuration of DRX_L in SS is FFS.

For test case 7.1.6.1 and 7.1.6.2, DRX will not be activated at the SS. Periodic UL grants every 5ms (suitable for both FDD and TDD and less than drx-InactivityTimer 6ms) will be allocated to the UE during the steps configuring test case specific DRX parameters of the test case to prevent UE from activating DRX; These grants may result in padding MAC PDU's transmitted by UE, which will be received by SS MAC and discarded.

7.16 Handover Sequences

7.16.1 Sequence of inter-cell handover

In general, the Inter-Cell handover is done without activation time, i.e. the timing information for configuration of the SS and sending of the RRCConnectionReconfiguration is 'Now'.

- 1. Transfer of the PDCP Count for AM DRBs from source to target cell:
 - a) Source Cell: Get PDCP COUNT.
 - b) Target Cell: Set PDCP COUNT.

NOTE 1: There shall be no further sending/receiving of AM DRB data before the HO has been done.

- 2. Target Cell: Inform the SS about the HO and about the source cell id.
- 3. Target Cell: Configure RACH procedure either dedicated or C-RNTI based.
- 4. Target Cell: Activate security.
- NOTE 2: For AM DRBs the PDCP count is maintained (for SRBs and UM DRBs the PDCP count is reset).
- 5. Target Cell: configure DRX and measurement gap configuration (if necessary).
- NOTE 3: As long as the DRX configuration is not modified by the RRCConnectionReconfiguration the target cell gets the same DRX configuration as the source cell.
- NOTE 3A: According to TS 36.331 clause 5.5.6.1 the measurement gap configuration is released at the UE due to the handover, therefore nothing needs to be configured at the target cell regarding measurement gaps unless a new measurement gap configuration is explicitly given in the RRCConnnectionReconfiguration.
- 6. Source Cell: Stop periodic TA.

NOTE 4: Unless explicitly specified UL grant configuration keeps configured as per default at the source cell.

- 7. Target Cell: Configure UL grant configuration ("OnSR", periodic TA is not started).
- 8. Source Cell: Send RRCConnectionReconfiguration.
- 9. Target Cell: Receive RRCConnectionReconfigurationComplete.
- 10. Target Cell: Start periodic TA.
- 11. Target Cell: Inform the SS about completion of the HO (e.g. to trigger PDCP STATUS PDU).
- 12. Target Cell: Re-configure RACH procedure as for initial access.
- 13. Source Cell: Reset SRBs and DRBs.
- 14. Source Cell: Release DRX and MeasGapConfig configuration.

7.16.2 Sequence of intra-cell handover

For Intra-Cell handover dedicated timing information is used: the sequence starts at time T with sending of the RRCConnectionReconfiguration. T is set to 300 ms in advance of the handover.

0. Before T: Get PDCP count for AM DRBs.

1. At T: Send RRCConnectionReconfiguration.

2. At T + 5ms: Release SRBs and DRBs.

3. At T + 5ms: Configure RACH procedure either dedicated or C-RNTI based.

NOTE 1: Since the RACH procedure may require a new C-RNTI to be used it cannot be configured before sending out the RRCConnectionReconfiguration.

3A At T + 5ms: Release MeasGapConfig configuration.

NOTE 2: According to TS 36.331, clause 5.5.6.1 the measurement gap configuration is released at the UE due to the handover, therefore MeasGapConfig is released unless a new measurement gap configuration is explicitly given in the RRCConnectionReconfiguration.

4. At T + 10ms: (Re-) configure SRBs and DRBs.

5. At T + 10ms: Reestablish security, disable TA transmission.

NOTE 3: For AM DRBs the PDCP count is maintained while for SRBs and UM DRBs the PDCP count is reset.

6. (after step 5) Receive RRCConnectionReconfigurationComplete.

7. (after step 6) Re-configure RACH procedure as for initial access, enable TA transmissions.

8. (after step 7) Restore the PDCP count for AM DRBs.

7.16.3 UL Grants used in RA procedure during handover

In the Random Access Procedure a grant is assigned to the UE by the Random Access Response and another grant, as initial grant, is assigned for contention resolution.

When UL data is pending, the UE will try to put as much data into given grants as possible, i.e. it will segment the user data and send it e.g. with the initial grant if possible. To avoid this segmentation of user data, the grants assigned during handover will be set in TTCN to:

Grant assigned by Random Access Response: 56 bits.

Initial grant: 104 bits.

NOTE 1: According to TS 36.321 [16], clause 5.1.4, 56 bits are the minimum grant which can be assigned by the Random Access Response. That is sufficient to convey C-RNTI (3 bytes) and short BSR (2 bytes) or long BSR (4 bytes) but even with short BSR the remaining 2 bytes are not sufficient to convey any segment of the RRCConnectionReconfigurationComplete (at least 4 bytes).

NOTE 2: The RRCConnectionReconfigurationComplete (9 bits) shall completely be conveyed in the initial grant of RA procedure. This requires a minimum of 10 bytes (1 byte MAC header + 2 bytes RLC header + 5 bytes PDCP header + 2 bytes payload). Additionally an optional PHR MAC element (2 bytes) needs to be considered since the PHR has higher priority than the MAC SDU. Any further user data would require a minimum of 5 additional bytes (2 bytes MAC header + 2 bytes RLC header + 1 byte payload).

7.17 Simulation of PDCP MAC-I Failure in UE

PDCP integrity protection test cases 7.3.4.x have the requirement to trigger MAC-I failures in UE for downlink messages; to achieve the MAC-I failure in UE two methods are specified in the subsequent sub clauses.

7.17.1 Integrity and ciphering not yet activated

UE has not yet started Integrity protection and it is required to trigger MAC-I failure for the PDCP PDU carrying RRC SecurityModeCommand starting integrity with one of integrity protection algorithms. Further a conformant UE will respond with SecurityModeFailure without any integrity protection.

This is achieved by:

Not configuring SS PDCP to start integrity and ciphering with selected algorithm.

RRC SecurityModeCommand is sent indicating Integrity protection through the desired algorithm.

Normal behaviour of PDCP layer in SS will include all zeros in MAC-I.

This results in MAC-I failure as UE will calculate the XMAC-I with indicated algorithm.

7.17.2 Integrity and/or ciphering already activated

UE has started Integrity protection (ciphering configured with possibly non null algorithm) and it is required to trigger MAC-I failure for the PDCP PDU carrying an RRC UECapabilityEnquiry message. A conformant UE will trigger a RRCConnectionReestablishment procedure.

This is achieved by:

Configuring SS PDCP to use a different Integrity algorithm other than used by UE (i.e. if UE is configured to use AES, SS is configured to use SNOW3G and vice versa).

Ciphering is configured at SS side same as in UE side.

The MAC-I included by SS PDCP will be as per new algorithm.

UE will calculate XMAC-I based on its own algorithm which is different from the algorithm SS has used and will result in MAC-I failure.

7.18 RRC Connection Release Sequence

According to TS 36.331 [19], clause 5.3.8.3, after reception of the RRCConnectionRelease the UE may either wait 60 ms or for indication of acknowledgement from lower layer. After the RRC connection release there are cases where the UE may immediately come up with an RRC connection request. This requires scheduled release of resources at the SS:

1. At T: Send RRCConnectionRelease, stop UL grants.

2. At T + 5ms: Release security.

3. At T + 10ms: Release DRX configuration at the SS.

3A At T + 15ms: Release measurement gap configuration at the SS.

4. At T + 50ms: no action.

5. At T + 55ms: Release SRBs and DRBs.

6. At T + 60ms: (Re-) configure SRBs and DRBs.

7. Delay of 840ms (NOTE)

T is set to 300ms in advance of RRC connection release.

NOTE: The delay ensures that the UE is camping on the serving cell again to avoid side effects e.g. due to subsequent power level changes. It does not affect any sending of messages by the UE. The delay 840ms is chosen to ensure the UE is re-camping on the cell and has read relevant system information, MIB, SIB1, SIB2 and all other SIs.

7.19 DL CCCH Message and Contention Resolution MAC Control Element transmission in one MAC PDU or in separate MAC PDUs

When the contention based RACH procedure is being executed (RRC Connection Establishment or RRC Connection Reconfiguration), in general the contention resolution MAC control element and the DL RRC PDU (RRC Connection Setup/RRC Connection Reject/RRC Connection Re-establishment/RRC Connection Re-establishment Reject) are sent in one MAC PDU. This is achieved by pre-configuring the SS (before the start of the RRC procedure) to send the encoded DL message and contention resolution MCE in one MAC PDU.

Nevertheless, due to specific test purposes there are still many cases where it is necessary to send the DL CCCH message separately:

RRC connection establishment

When RRC connection establishment is part of the test purpose

Special cases: , e.g. when no contention resolution shall be sent according to the test purpose

RRC Connection Reestablishment is part of the test purpose

RRC Connection Reject is part of the test purpose

RRC Connection Reestablishment Reject is part of the test purpose

NOTE: The way contention resolution is applied has impact on the DCI format being used in a test case: when the DL CCCH message is sent separately DCI combination 1 according to clause 7.3.1 shall be used.

7.20 RRC Connection Reconfiguration Sequence (Measurement Control)

When an RRC Connection Reconfiguration message contains information to configure measurement gaps at the UE according to TS 36.331 [19] clause 5.5.2.9, the SS needs to be configured accordingly:

IF MeasConfig contains measGapConfig:

- 1. At T: Send RRC Connection Reconfiguration.
- 2. At T + 5ms: Configure measurement gaps at the SS.
- 3. (after step 2) Receive RRC Connection Reconfiguration Complete

ELSE

- 1. Send RRC Connection Reconfiguration (without scheduling)
- 2. Receive RRC Connection Reconfiguration Complete.

T in general is set to 100ms in advance of the RRC connection reconfiguration.

7.21 GERAN special issues

7.21.1 Timeslot assigned for GERAN CS traffic

Timeslot 3 shall be used as the timeslot assigned for GERAN CS traffic, in order to avoid conflicts with timeslots reserved for other purposes (e.g. the GPRS channel which is assigned to timeslot 4).

7.21.2 Subchannel used in GERAN L2 access message

The subchannel is valid only for the following logical channel types: FACCH/H, SDCCH/8, SDCCH/4. For other logical channel types this field is not applicable and shall be coded as 15 for compatibility with TTCN2 test cases. The SS shall ignore it if this field is coded as 15.

7.22 EUTRAN RSRQ Calculations

7.22.1 Assumptions

- As per 36.214[53] clause 5.1.1 and 5.12, the RSRP and RSSI shall be averaged over the same set of resource blocks. It is assumed that the power calculations made over one symbol are good enough for RSRQ calculations. This is based on the assumption that the power levels remain the same across the symbols on which the UE is calculating the average. The contribution of Nprb and the OFDM symbols carrying cell specific reference symbols per PRB contribute equally in numerator and denominator, hence RSRQ calculations in dB with aggregation over cell DL bandwidth and without aggregation result in the same output.
- As per table 7.4.3.1.1-1, for FDD the timing offset between the intra frequency cells is always a multiple of sub frame duration i.e. 3072 Ts, hence in the symbols carrying cell-specific reference signals in one cell, the other cell (interference) is also carrying a cell-specific reference signal, even though in a different subframe. Hence from an interference calculation perspective, we can safely assume that the cells contributing an interference shall also transmit the same cell specific reference signal in the symbol/
- The noise source is treated as a dummy cell transmitting on all resource elements with equal EPRE. Hence to switch off the noise source, a value of non-suitable "Off" cell, as per 36.508[3] table 6.2.2.1-1 shall be used (<-145), and the signal level uncertainties similar to configured cells in 36.508[3] clause 6.2.2.1 will also be applied to the noise source.

7.22.2 The Ideal Calculation

The test case specifies the RS-EPRE (dBm/15kHz) which is the cell absolute power-cell attenuation in dBm per carrier of 15 kHz; the linear average over few measurements will give the RRP value.

It is assumed that the power levels of all contributors is fluctuating hence in the typical test environment RS-EPRE will be the RSRP over a single carrier frequency.

The RS-EPREmW(mW/15kHz) = 10 power (RSRP/10).

The energy in noise source [Noc] for the frequency is also specified in the same units of dBm/15kHz.

The RSSImW calculation(mW over a resource block frequency of 180 kHz) = 2 (the sum over all intra frequency configured cells RS-EPREmW) + 10 power ((Noc/10)*12.

The cell inference is multiplied by 2 as in a RB, cell specific reference is transmitted in only 2 carriers. But the AWGN transmits on all 12 carriers in the resource block.

The RQRQ in dB will be the 10*log (RS-EPREmW/RSSImW).

7.22.3 Additional RSRQ Calculations For Fixing Boundary Values

In addition to the ideal calculation, various RSRQ calculations take into consideration the combinations of the SS signal uncertainties and possibly all 12 carriers being used for DL transmission.

The 12 carriers being used can happen when the UE makes the measurement in a subframe when a DL PDSCH is scheduled or measurement is in subframe zero and the UE measures in OFDM symbol carrying PBCH i.e. slot 1, symbol 0.

The Min and Max RSRQ values are identified from 6 different RSRQ calculations:

RSRQ Ideal: RSRQ calculated in ideal conditions as given above

RSRQ Min: RSRQ calculation applying -ve signal uncertainty to all configured cells and noise source

RSRQ Max: RSRQ calculation applying +ve signal uncertainty to all configured cells and noise source

RSRQ Max Worst Case: RSRQ calculation applying +ve signal uncertainty for measured cell and -ve signal uncertainty to all remaining configured cells and noise source. This shall be the Max RSRQ possible

RSRQ Max And 12 Carriers: RSRQ calculation applying +ve signal uncertainty to all configured cells and noise source and cell interference considered over all 12 carriers

RSRQ Min Worst Case And 12 Carriers: RSRQ calculation applying -ve signal uncertainty for measured cell and +ve signal uncertainty to all others; and cell interference considered over all 12 carriers. This shall be the Min RSRQ possible

Applying UE measurement accuracy 36.133[37], Table 9.1.6.2-1, +/-4dB normal conditions and side conditions of RSRQ when RSRP \hat{E} s/Iot \geq -6 dB & RSRP \geq -124 dBm the final boundary value for RSRQ is

Min RSRQ With UE Meas Acc := Min RSRQ -4 dB

Max RSRQ With UE Meas Acc := Max RSRQ + 4 dB

For conditions to fulfil desired cell selection or reselection, the respective conditions shall be satisfied for both the boundary values Min RSRQ RSRQ With UE Measurement Accuracy and Max RSRQ With UE Measurement Accuracy.

As the Boundary conditions also consider the worst scenario of all 12 carriers being transmitted, the requirement for OCNG is removed. There is no need to restrict measurement bandwidth and will be applicable for both DCI formats.

8 External Function Definitions

The following external functions are required to be implemented by the SS.

TTCN-3 External Function				
Name	fx_KeyDerivationFunction	on		
Description		ning algorithms as defined in TS 33.401 [24] thm is used as KEY Description Function		
Parameters	KDF	KDF_HMAC_SHA_256 (no other KDF defined yet)		
	Key	256 bit key		
	String	string being constructed acc. to TS 33.401 [24], annex A		
Return Value	256 bit derived key			

	TTCN-3 External Function				
Name	fx_NasIntegrityAlgorithm				
Description	Apply integrity protection a	algorithm on a given octetstring			
Parameters	NAS PDU	octetstring according to TS 24.301 [21], clause 4.4.3.3 this shall include octet 6 to n of the security protected NAS message, i.e. the sequence number IE and the NAS message IE			
	Integrity Algorithm	3 bits as defined in TS 24.301 [21], clause 9.9.3.23			
	KNAS _{int}	Integrity key			
	NAS COUNT	as documented in TS 24.301			
	BEARER Id	fix value ('00000'B) acc. TS 33.401 [24], clause 8.1			
	Direction	UL: 0			
		DL: 1			
		(acc. to TS 33.401 [24], clause B.1)			
Return Value	Message Authentication C	code (4 octets)			

TTCN-3 External Function				
Name	fx_NasCiphering			
Description	Apply ciphering on a give	ven octetstring		
Parameters	NAS PDU	octetstring		
	Ciphering Algorithm	3 bits as defined in TS 24.301 [21], clause 9.9.3.23		
	KNAS _{enc}	Ciphering Key		
	NAS COUNT	as documented in TS 24.301		
	BEARER Id	fixed value ('00000'B) acc. TS 33.401 [24], clause 8.1		
Return Value	ciphered octet string			

TTCN-3 External Function				
Name	fx_NasDeciphering			
Description	Apply deciphering on a	given octetstring		
Parameters	ciphered NAS PDU	octetstring		
	Ciphering Algorithm	3 bits as defined in TS 24.301 [21], clause 9.9.3.23		
	KNAS _{enc}	Ciphering Key		
	NAS COUNT	as documented in TS 24.301 [21]		
	BEARER Id	fixed value ('00000'B) acc. TS 33.401 [24], clause 8.1		
Return Value	deciphered octet string			

TTCN-3 External Function					
Name	Name fx_GetCurrentTestcaseName				
Description	external function giving back the name of the test case currently running				
Parameters	None				
Return Value	char string				

	TTCN-3 External Function			
Name	fx_AsIntegrityAlgorithm	fx_AsIntegrityAlgorithm		
Description	Apply integrity protection a	algorithm on a given octetstring		
Parameters	PDCP PDU	octetstring		
	Integrity Algorithm	3 bits as defined in TS 33.401 [24]		
	KRRC _{int}	Integrity key		
	PDCP COUNT	octetstring, length 4		
	BEARER Id	the value of the DRB identity minus one		
	Direction	UL: 0		
		DL: 1		
		(acc. to TS 33.401 [24], clause B.2)		
Return Value	Message Authentication C	Code (4 octets)		

TTCN-3 External Function				
Name	fx_AsCiphering			
Description	Apply ciphering on a give	ven octetstring		
Parameters	SDU	octetstring		
	Ciphering Algorithm	3 bits as defined in TS 33.401 [24]		
	KRRCenc	Ciphering Key		
	PDCP COUNT	octetstring, length 4		
	BEARER Id	the value of the DRB identity minus one		
Return Value	ciphered octet string			

	TTCN-3 External Function				
Name	fx_AsDeciphering				
Description	Apply deciphering on a	given octetstring			
Parameters	ciphered SDU	octetstring			
	Ciphering Algorithm	3 bits as defined in TS 33.401 [24]			
	KRRC _{enc}	Ciphering Key			
	PDCP COUNT	octetstring, length 4			
	BEARER Id	the value of the DRB identity minus one			
Return Value	deciphered octet string				

	TTCN	I-3 External Function
Name	fx_GetSystemTime	***
Description	Function to get the syste	m time: Implementation is based on C standard library (time.h)
Parameters	p_Struct_tm (out)	p_Struct_tm returns local system time equivalent to "struct tm" as defined for C standard library (time.h or ctime):
		<pre>type record Struct_tm_Type { integer tm_sec, // seconds after the minute</pre>
		for leap seconds in certain systems C implementation: time_t v_Now = time(NULL); struct tm *v Tm = localtime(&v Now);
	p_TimezoneInfo (out)	p_TimezoneInfo returns the difference (in seconds) between the UTC time (GMT) and the local time (integer value);
		<pre>C implementation: int timezone = (int) difftime (mktime (gmtime (&v_Now)), v_Now);</pre> NOTE:
Determ Velo	News	p_TimezoneInfo does not consider daylight saving e.g. it is always 3600 for CET independent of summer/winter
Return Value	None	

9 IXIT Proforma

This partial IXIT proforma contained in the present document is provided for completion, when the related Abstract Test Suite is to be used against the Implementation Under Test (IUT).

Text in *italics* is a comment for guidance for the production of an IXIT, and is not to be included in the actual IXIT.

The completed partial IXIT will normally be used in conjunction with the completed ICS, as it adds precision to the information provided by the ICS.

9.1 E-UTRAN PIXIT

Table 9.1-1: CommonPIXIT

Parameter Name	Parameter Type	Default Value	Supported Values	Description
px_AccessPointName	octetstring			Access Point Name, as defined in TS 23.003 [48] and used in TS 24.008 [20], clause 10.5.6.1
px_AttachTypeTested	EUTRA_ATTAC H_TESTED_Typ e	EPS_ATTACH_ON LY	EPS_ATTA CH_ONLY, COMBINED _ATTACH	Attach Type to be tested, if UE supports both pc_Attach and pc_Combined_Attach
px_eAuthRAND	B128_Type	oct2bit('A3DE0C6 D363E30C364A40 78F1BF8D577'O)		Random Challenge
px_eJapanMCC_Band6	NAS_Mcc	'442'H		Japan MCC code to be used for Band 6. The same value will be used for E-UTRA and Inter-RAT cells. Type is different to that defined in TS 34.123-3 [7]
px_PWS_CB_DataPage1	charstring			ETWS or CMAS Page 1 warning data message
px_PWS_CB_DataPage2	charstring			ETWS or CMAS Page 2 warning data message
px_PWS_CB_DataPage3	charstring			ETWS or CMAS Page 3 warning data message
px_PWS_CB_DataPage4	charstring			ETWS or CMAS Page 4 warning data message
px_ETWS_DigitalSignature	O43_Type			ETWS Digital Signature
px_IPv4_Address1_UE	charstring			IPv4 Address connected to PDN1
px_IPv4_Address2_UE	charstring			IPv4 Address connected to PDN2
px_IPv4_Address1_NW	charstring			IPv4 Gateway Address in PDN1
px_lpv4_Address2_NW	charstring			Ipv4 Gateway Address in PDN2
px_lpv4_Address_HomeAgent	charstring			Ipv4 Home Agent Address
px_IPv6_Address1_UE	charstring			IPv6 Address connected to PDN1
px_IPv6_Address2_UE	charstring			IPv6 Address connected to PDN2
px_IPv6_Address1_NW	charstring			IPv6 Gateway Address in PDN1
px_lpv6_Address2_NW	charstring			Ipv6 Gateway Address in PDN2
px_lpv6_Address_HomeAgent	charstring			Ipv6 Home Agent Address
px_ip vo_, taarees_, terrie, tgent	- Cridiothing			Whether the operator can check
px_SMS_ChkMsgReceived	boolean	true		an MT Short Message received
px_SMS_MsgFrmt	charstring	"1"		UE which only supports PDU mode will be configured for text mode
px_RATComb_Tested	RATComb_Test ed_Type	EUTRA_UTRA	EUTRA_UT RA, EUTRA_GE RAN, EUTRA_Onl y	This parameter represents the network RAT capability / preference and indicates which, if any is supported, RAT combination is to be tested.
px_SinglePLMN_Tested	SinglePLMN_Te sted_Type	MultiPLMN	SinglePLM N, MultiPLMN	This parameter represents the network capability/preference to support multi PLMNs on the

Parameter Name	Parameter Type	Default Value	Supported Values	Description
				same test Band and indicates the preference of multi PLMNs or single PLMN test environment.
px_UE_ CS_PS_UsageSetting_Tested	CS_PS_MODE	VOICE_CENTRIC	VOICE_CE NTRIC, DATA_CEN TRIC	Specifies which CS/PS mode is under test
px_UE_PS_UsageSetting_Test ed	PS_MODE	VOICE_CENTRIC	VOICE_CE NTRIC, DATA_CEN TRIC	Specifies which PS mode is under test
px_UTRAN_ModeUnderTest	UTRAN_FDD_T DD	UTRAN_FDD	UTRAN_FD D, UTRAN_TD D	Specifies which radio access technology is being tested in UTRAN
px_TestLoopModeB_Delay	O1_Type	'5A'		This parameter represents the IP_PDU_delay to be used for UE test loop mode B in test cases, where long delay may be needed e.g. because of user interaction.

Table 9.1-2: E-UTRAN PIXIT

Parameter Name	Parameter Type	Default Value	Supported Values	Description
px_eTDDsubframeConfig	TDD_SubframeA ssignment_Type	1		TDD uplink-downlink subframe configuration

10 Postambles

The purpose of this clause is to specify postambles to bring the UE to a well defined state regardless of the UE state at the termination of main test body or of the SS conditions and values of the system information inherited from the test.

10.1 Postambles for E-UTRA to UTRA tests

This clause describes UE postamble procedures which are used at the end of inter-RAT test cases specified in TS 36.508 [3] so as to switch off the UE.

UE LTE and UTRAN postamble conditions are specified in table 10.1-1.

Table 10.1-1: UE postamble conditions

LTE UE attach type	UE UTRA CS/PS domain	Postamble condition
attach	pc_CS AND pc_PS	C1
	pc_PS AND NOT (pc_CS)	C2
combined_attach	pc_CS AND pc_PS	C3
	pc_CS AND NOT (pc_PS)	C4

10.1.1 UE postamble states and procedures for E-UTRA to UTRA

In order to bring the UE to the switched/powered off state, a number of procedures need to be executed in a hierarchical sequence, according to the reference end state specified in each test procedure sequence. The sequences and the identified procedures are shown in figure 10.1.1-1.

Figure 10.1.1-1: UE postamble procedures for E-UTRA / UTRA test cases

NOTE 1: Depending on the test case specifications the termination of a test case can be in any state of figure 10.1.1-1.

UE in UTRA state U2, U3, U4 and U5 may send data on the established radio bearer and shall be accepted and handled.

NOTE 2: NAS and AS security procedures during routing area update and handover are performed according to TS 33.401 [24], clauses 9.1.1 and 9.2.1 and TS 25.331 [36], clause 8.3.6.3.

10.3 Postambles for E-UTRA test cases

This clause describes UE postamble states which can be used in the post condition of E-UTRA test cases defined in TS 36.523-1 [1]. The clause also specifies a set of procedures to bring the UE into these states.

10.3.1 UE postamble states and procedures for E-UTRA test cases

In order to bring the UE to switched/powered off state there are some procedures that need to be executed. The identified procedures are shown in figure 10.3.1-1.

Figure 10.3.1-1: UE postamble states and procedures for E-UTRA

10.4 Postambles for E-UTRA to HRPD test cases

This clause describes UE postamble states which can be used in the post condition of E-UTRA test cases defined in TS 36.523-1 [1]. The clause also specifies a set of procedures to bring the UE into these states.

10.4.1 UE postamble procedures for E-UTRA to HRPD (No Pre-Registration)

10.4.1.1 Registration on HRPD Cell

Table 10.4.1.1: Registration on HRPD Cell procedure

Step	Procedure		Message Sequence	
Step			Message	
1	The UE transmits a UATIRequest message.	>	UATIRequest	
2	The SS transmits <i>UATIAssignment</i> message	<	UATIAssignment	
3	The UE transmits UATIComplete message	>	UATIComplete	
4	The UE transmits ConnectionRequest	>	ConnectionRequest	
	message.		·	
5	The SS transmits a TrafficChannelAssignment	<	TrafficChannelAssignment	
	message.			

			Message Sequence
Step	Procedure	U-S	Message
6	The UE transmits TrafficChannelcomplete.	>	TrafficChannelcomplete

3	the UE and SS perform Session update to	<>	-	
	release the reservations			

11 Guidelines on test execution

This clause provides the guidelines on test executions.

The restriction on test case execution as listed in this clause is due to the restriction of bandwidth to accommodate the necessary number of radio frequencies for the specific operating Band as used by the test cases.

11.1 EUTRA single technology

This clause provides the guidelines for the test cases to be executed on the pure EUTRA test configuration.

A test case using more than one radio frequency, i.e. using the radio frequencies f2 or f3 or f4 specified in TS 36.508 [3], shall avoid to be executed on operating:

Band 12 with 10MHz bandwidth,

Band 13,

Band 17 with 10MHz bandwidth,

Band 18.

The list containing such test cases is given below:

6.1.1.1, 6.1.1.2, 6.1.1.3, 6.1.1.6, 6.1.2.7, 6.1.2.8, 6.1.2.9, 6.1.2.11, 6.1.2.13, 6.1.2.15, 6.1.2.17, 6.1.2.18, 6.3.1, 6.3.5, 6.3.6,

8.1.3.4, 8.1.3.5, 8.2.4.6, 8.3.1.3, 8.3.1.3a, 8.3.1.4, 8.3.1.6, 8.3.1.9, 8.3.1.10, 8.3.1.11, 8.3.4.2, 8.3.4.3, 8.6.2.2, 8.6.2.8, 8.6.4.2, 8.6.4.3, 8.6.4.6, 8.6.6.2, 8.6.6.3,

9.2.1.1.1a, 9.2.1.1.7, 9.2.1.1.13, 9.2.1.1.15, 9.2.1.1.16, 9.2.1.2.1, 9.2.1.2.10, 9.2.1.2.12, 9.2.1.2.14, 9.2.3.2.1, 9.2.3.2.12, 9.2.3.2.15, 9.2.3.2.16,

11.2.6, 11.2.7,

13.4.1.2.

A test case using more than two radio frequencies, i.e. using the radio frequencies f3 or f4 specified in TS 36.508 [3], shall avoid to be executed on operating:

Band 6,

Band 11,

Band 14.

Band 17 with 5MHz bandwidth,

Band 23 with 10MHz bandwidth,

Band 38

Band 39

The list containing such test cases is given below:

6.1.1.1, 6.1.1.2, 6.1.1.3, 6.1.1.6, 6.1.2.7, 6.1.2.8, 6.1.2.9, 6.1.2.15,

8.1.3.5, 8.3.1.4, 8.6.4.3,

9.2.1.1.1a, 9.2.1.1.7, 9.2.1.1.15.

A test case using more than three radio frequencies, i.e. using the radio frequency f4 specified in TS 36.508 [3], shall avoid to be executed on operating:

Band 12 with 5MHz bandwidth,

Band 19,

Band 20.

Band 21,

Band 27,

Band 34.

The list containing such test cases is given below:

6.1.1.1, 6.1.1.2, 6.1.1.6,

9.2.1.1.7.

11.1.1 Replacement of test case execution

In case of bandwidth limitation for accommodation of more frequencies, a number of test cases can be replaced with the corresponding mirror test cases without affecting the test coverage. The table 11.1.1-1 shows the possible replacements. Only one of the paired test cases is required for execution.

Table 11.1.1-1: Replacement of test cases

Original test case	Replacing test case
6.1.1.1	6.1.1.1b
6.1.1.2	6.1.1.2a
6.1.1.3	6.1.1.3b
6.1.1.6	6.1.1.6a
6.1.2.7	6.1.2.7a
6.1.2.8	6.1.2.8a
6.1.2.9	6.1.2.9a
8.3.1.9	8.3.1.9a
8.3.1.11	8.3.1.11a
9.2.1.1.1a	9.2.1.1.1b
9.2.1.1.7	9.2.1.1.7a
9.2.1.1.13	9.2.1.1.13a
9.2.1.1.15	9.2.1.1.15a
9.2.1.1.16	9.2.1.1.16a

11.2 EUTRA – UTRA - GERAN

This clause contains the guidelines for the EUTRA interRAT test cases to be executed on the different test configurations: with only UTRA configured, with only GERAN configured or with UTRA-GERAN both configured. Whether or not an EUTRA frequency band overlaps the UTRA band, the dependency will affect the restrictions of the test execution on this band.

Editor's note: an EUTRA band overlaps the GSM band is FFS.

11.2.1 UTRA configured – GERAN not configured

This clause provides the guidelines for the EUTRA interRAT test cases where UTRA is configured, while GERAN is either not needed or not configured.

11.2.1.1 EUTRA band overlapping UTRA band

The restriction on test case execution as listed in this clause is due to the bandwidth of an EUTRA Band accommodating the necessary number of EUTRA or EUTRA, UTRA radio frequencies if an E-UTRA band overlaps the UTRA Band. A test case using more than one radio frequency, on the same EUTRA and UTRA band, shall avoid to be executed on operating

Band 12 with 10MHz bandwidth,

Band 13.

Band 17 with 10MHz bandwidth,

Band 18.

The list containing such test cases is given below:

```
6.2.1.2, 6.2.1.3, 6.2.2.1, 6.2.2.5, 6.2.2.8, 6.2.3.3, 6.2.3.3a, 6.2.3.4, 6.2.3.4a, 6.2.3.5, 6.2.3.5a, 6.2.3.6, 6.2.3.13, 6.2.3.31, 6.2.3.32, 6.2.3.33, 6.3.3, 6.3.4, 6.3.7, 6.3.8,
```

```
8.1.3.6, 8.1.3.6a, 8.1.3.7, 8.3.2.3, 8.3.2.3a, 8.3.2.4, 8.3.3.2, 8.3.4.4, 8.4.1.2, 8.4.1.4, 8.4.1.5, 8.4.2.2, 8.4.2.4, 8.5.2.1, 8.6.3.1, 8.6.5.1, 8.6.7.1, 8.7.1,
```

11.2.10, 11.2.11,

13.1.2, 13.1.2a, 13.1.3, 13.1.4, 13.1.5, 13.1.15, 13.1.16, 13.3.2.1, 13.4.2.1, 13.4.2.4, 13.4.3.1, 13.4.3.2, 13.4.3.4, 13.4.2.6.

A test case using more than two radio frequencies on the same EUTRA and UTRA band shall avoid to be executed on operating:

Band 6,

Band 11,

Band 14,

Band 17 with 5MHz bandwidth,

Band 23 with 10MHz bandwidth,

Band 38,

Band 39.

The list containing such test cases is given below:

```
6.2.1.2, 6.2.1.3,
```

9.2.1.2.9, 9.2.1.2.11, 9.2.1.2.13, 9.2.3.1.15, 9.2.3.1.18, 9.2.3.2.5, 9.2.3.2.6, 9.2.3.2.7, 9.2.3.2.8, 9.2.3.2.11, 9.2.3.2.13, 9.2.3.2.14.

A test case using more than three radio frequencies, on the same EUTRA and UTRA band shall avoid to be executed on operating

```
Band 12 with 5MHz bandwidth,
Band 19,
Band 20,
Band 21,
Band 27,
```

Band 34.

The list containing such test cases is given below:

9.2.1.2.13.

11.2.1.2 EUTRA band not overlapping UTRA band

The restriction on test case execution as listed in this clause is due to the bandwidth of an EUTRA Band accomodating the necessary number of EUTRA radio frequencies. A test case using more than one radio frequency shall avoid to be executed on E-UTRA operating

```
Band 12 with 10MHz bandwidth,
Band 13,
Band 17 with 10MHz bandwidth,
Band 18.
```

The list containing such test cases is given below:

```
6.2.1.2, 6.2.1.3,
9.2.1.2.9, 9.2.1.2.11, 9.2.1.2.13, 9.2.3.1.15, 9.2.3.1.18, 9.2.3.2.5, 9.2.3.2.6, 9.2.3.2.7, 9.2.3.2.8, 9.2.3.2.11, 9.2.3.2.13, 9.2.3.2.14,
```

A test case using more than two radio frequencies shall avoid to be executed on E-UTRA operating

```
Band 6,
Band 11,
Band 14,
Band 17 with 5MHz bandwidth,
Band 23 with 10MHz bandwidth,
Band 38,
Band 39.
```

The list containing such test cases is given below:

9.2.1.2.13.

11.2.2 GERAN configured - UTRA not configured

This clause provides the guidelines for the EUTRA/GERAN test cases where UTRA is either not needed or not configured. The restriction on test case execution as listed in this clause is due to the restriction of bandwidth of an EUTRA Band accomodating the necessary number of EUTRA radio frequencies.

A test case using more than one radio frequency shall avoid to be executed on E-UTRA operating

Band 12 with 10MHz bandwidth,

Band 13,

Band 17 with 10MHz bandwidth,

Band 18.

The list containing such test cases is given below:

```
6.2.1.4, 6.2.3.17, 6.2.3.18,
```

9.2.1.2.9, 9.2.1.2.11, 9.2.1.2.13, 9.2.3.1.15, 9.2.3.1.18, 9.2.3.2.5, 9.2.3.2.6, 9.2.3.2.7, 9.2.3.2.8, 9.2.3.2.11, 9.2.3.2.13, 9.2.3.2.14.

A test case using more than two radio frequencies, i.e. using the radio frequencies f3 or f4 specified in TS 36.508 [3], shall avoid to be executed on operating:

Band 6,

Band 11.

Band 14,

Band 17 with 5MHz bandwidth,

Band 23 with 10MHz bandwidth,

Band 38

Band 39

The list containing such test cases is given below:

9.2.1.2.13.

11.2.3 Neither UTRA nor GERAN configured

Certain EMM test cases can be executed as EUTRA_Only configuration despite of UTRA or GERAN test branches included in the test cases. The restriction on test case execution as listed in this clause is due to the bandwidth of an EUTRA Band accommodating the necessary number of EUTRA radio frequencies.

A test case using more than one radio frequency shall avoid to be executed on E-UTRA operating

Band 12 with 10MHz bandwidth,

Band 13,

Band 17 with 10MHz bandwidth,

Band 18.

The list containing such test cases is given below:

9.2.3.1.15, 9.2.3.1.18.

11.2.4 Both UTRA and GERAN configured

This clause provides the guidelines for the EUTRA - UTRA - GERAN test cases where three RAT technologies are simultaneously configured.

11.2.4.1 EUTRA band overlapping UTRA band

The restriction on test case execution as listed in this clause is due to the bandwidth of an EUTRA Band accommodating the necessary number of EUTRA or EUTRA, UTRA radio frequencies if an E-UTRA band overlaps the UTRA Band.

A test case using more than one radio frequency shall avoid to be executed on E-UTRA operating

Band 12 with 10MHz bandwidth,

Band 13,

Band 17 with 10MHz bandwidth,

Band 18.

The list containing such test cases is given below:

```
6.2.1.1, 8.3.2.5, 8.3.2.6,
```

9.2.1.2.6, 9.2.1.2.7, 11.2.8

A test case using more than two radio frequencies, i.e. using the radio frequencies f3 or f4 specified in TS 36.508 [3], shall avoid to be executed on operating:

Band 6,

Band 11,

Band 14,

Band 17 with 5MHz bandwidth,

Band 23 with 10MHz bandwidth,

Band 38

Band 39

The list containing such test cases is given below:

6.2.1.1.

11.2.4.2 EUTRA band not overlapping UTRA band

The restriction on test case execution as listed in this clause is due to the restriction of bandwidth of an EUTRA Band accomodating the necessary number of EUTRA radio frequencies.

A test case using more than one radio frequency shall avoid to be executed on E-UTRA operating

Band 12 with 10MHz bandwidth,

Band 13,

Band 17 with 10MHz bandwidth,

Band 18.

The list containing such test cases is given below:

6.2.1.1

11.2.5 Replacement of test case execution

In case of bandwidth limitation for accommodation of more frequencies, a number of te st cases can be replaced with the corresponding mirror test cases without affecting the test coverage. The table 11.2.1.5-1 shows the possible replacements. Only one of the paired test cases is required for execution.

Table 11.2.5-1: Replacement of interRAT test cases

Original test case	Replacing test case
9.2.3.1.15	9.2.3.1.15a
9.2.3.1.18	9.2.3.1.18a

11.3 Guidelines for EUTRA inter-band

The restriction on test case execution as listed in this clause is due to the restriction of bandwidth of an EUTRA band accommodating the necessary number of EUTRA radio frequencies. The inter-band test includes also EUTRA FDD-TDD and inter-band carrier aggregation tests.

11.3.1 Primary operating band

A t est case using more than one radio frequency on the first operating band, shall avoid to be executed on operating

Band 12 with 10MHz bandwidth,

Band 13,

Band 17 with 10MHz bandwidth,

Band 18.

The list containing such test cases is given below:

6.1.2.15a, 8.1.3.12.

11.3.2 Secondary operating band for inter-band cells

Test case using more than one radio frequency, on the second operating band, shall avoid to be executed on operating

Band 12 with 10MHz bandwidth,

Band 13,

Band 17 with 10MHz bandwidth,

Band 18.

The list containing such test cases is given below:

 $6.1.1.1a, \, 6.1.1.3a, \, 6.1.1.4a, \, 6.1.2.16, \, 8.1.3.11a, \, 8.2.4.13a, \, 8.2.4.14a, \, 8.3.1.12a, \, 8.3.1.14a, \, 8.6.4.4.$

Annex A (normative): Test Suites

This annex contains the approved TTCN Test Suites. The test suites have been produced using the Testing and Test Control Notation version 3 (TTCN3) according to ES 201 873-1 [13].

A.1 Baseline of specifications

Table A.1 shows the baseline of the relevant cores specifications and the test specifications which the delivered TTCN test suites are referred to.

Table A.1: References of the test and Core specifications

Core specifications	TS 36.331 [19]
baseline	TS 24.301 [21]
Test specifications	TS 36.508 [3]
	TS 36.509 [4]
	TS 36.523-1 [1]
	TS 36.523-2 [2]

A.2 E-UTRA Test Suites

Table A.2 lists all approved test cases. An "X" in columns FDD or TDD indicates the test case approved for the respective variant.

Table A.2: E-UTRA/EPS TTCN test cases

Test case	Description	FDD	TDD
6.1.1.1	PLMN selection of RPLMN, HPLMN/EHPLMN, UPLMN and OPLMN/Automatic mode	Х	Χ
6.1.1.1a	PLMN selection / Automatic mode / between FDD and TDD	Χ	Χ
6.1.1.1b	PLMN selection of RPLMN, HPLMN/EHPLMN, UPLMN and OPLMN / Automatic mode /	Х	Χ
	Single Frequency operation		
6.1.1.2	PLMN selection of "Other PLMN/access technology combinations" / Automatic mode	Χ	Χ
6.1.1.2a	PLMN selection of "Other PLMN/access technology combinations" / Automatic mode /	Х	Χ
	Single Frequency operation		
6.1.1.3	Cell reselection of ePLMN in manual mode	Х	Χ
6.1.1.3a	Cell reselection of ePLMN in manual mode / between FDD and TDD	Х	Χ
6.1.1.3b	Cell reselection of ePLMN in manual mode / Single Frequency operation	Χ	Χ
6.1.1.4	PLMN selection in shared network environment / Automatic mode	Х	Χ
6.1.1.6	PLMN selection of RPLMN, HPLMN/EHPLMN, UPLMN and OPLMN / Automatic mode /	Χ	Χ
	User reselection		
6.1.1.6a	PLMN selection of RPLMN, HPLMN/EHPLMN, UPLMN and OPLMN / Automatic mode /	Х	Χ
	User reselection / Single Frequency operation		
6.1.2.2	Cell selection, Qrxlevmin	Х	Χ
6.1.2.2a	Cell selection / Qqualmin	Х	Χ
6.1.2.3	Cell selection/Intra E-UTRAN/Serving cell becomes non-suitable (S<0 or barred)	Χ	Χ
6.1.2.4	Cell reselection	Х	Χ
6.1.2.5	Cell reselection for inter-band operation	Х	Χ
6.1.2.6	Cell reselection using Qhyst, Qoffset and Treselection	Х	Χ
6.1.2.7	Cell reselection/Equivalent PLMN	Х	Χ
6.1.2.7a	Cell reselection / Equivalent PLMN / Single Frequency operation	Χ	Χ
6.1.2.8	Cell reselection using cell status and cell reservations/Access control class 0 to 9		Χ
6.1.2.8a	Cell reselection using cell status and cell reservations / Access control class 0 to 9 / Single	Х	Χ
	Frequency operation		
6.1.2.9	Cell reselection using cell status and cell reservations/Access control class 11 to15	Х	Χ
6.1.2.9a	Cell reselection using cell status and cell reservations / Access control class 11 to 15 /	Χ	Χ

Test case	Description	FDD	TDD
	Single Frequency operation		
6.1.2.10	Cell reselection in shared network environment	Х	X
6.1.2.11	Inter-frequency cell reselection	Χ	Χ
6.1.2.12	Cell reselection / Cell-specific reselection parameters provided by the network in a neighbouring cell list	X	Χ
6.1.2.13	Cell re-selection, Sintrasearch, Snonintrasearch	Х	Χ
6.1.2.14	Speed-dependent cell reselection	Х	X
6.1.2.15	Inter-frequency cell reselection according to cell reselection priority provided by SIBs	Х	X
6.1.2.15a	Inter-frequency cell reselection according to cell reselection priority provided by SIBs / Between FDD and TDD	Х	Х
6.1.2.15b	Inter-band cell reselection according to cell reselection priority provided by SIBs	Х	
6.1.2.16	Cell reselection / interband operation / Between FDD and TDD	Х	Χ
6.2.1.1	Inter-RAT PLMN selection / Selection of correct RAT for OPLMN / Automatic mode	Х	
6.2.1.2	Inter-RAT PLMN selection / Selection of correct RAT for UPLMN / Automatic mode	Х	Х
6.2.1.3	Inter-RAT PLMN selection / Selection of correct PLMN and RAT in shared network environment / Automatic mode	Х	
6.2.1.4	Inter-RAT PLMN selection / Selection of correct RAT from the OPLMN list / Manual mode	Х	Χ
6.2.1.6	Inter-RAT background HPLMN search / Search for correct RAT for HPLMN / Automatic mode	X	X
6.2.2.1	Inter-RAT cell selection/From E-UTRA RRC_IDLE to UTRA_Idle/Serving cell becomes non-suitable	Х	Х
6.2.2.2	Inter-RAT cell selection / From E-UTRA RRC_IDLE to GSM_Idle/GPRS Packet_idle / Serving cell becomes non-suitable	Х	Х
6.2.2.3	Inter-RAT cell selection / From E-UTRA RRC_IDLE to HRPD Idle / Serving cell becomes non-suitable	Х	
6.2.2.4	Inter-RAT cell selection / From E-UTRA RRC_IDLE to 1xRTT Dormant / Serving cell becomes non-suitable	Х	
6.2.2.5	Cell selection / No USIM	Х	
6.2.2.6	Inter-RAT Cell selection / From GSM_Idle/GPRS Packet_idle to E-UTRA RRC_IDLE / Serving cell becomes non-suitable	X	Х
6.2.2.7	Inter-RAT Cell selection / From GSM_Idle/GPRS Packet_idle to E-UTRA RRC_IDLE /	Х	Х
6.2.2.8	Serving cell is barred Inter-RAT cell selection / From UTRA_Idle to E-UTRA RRC_IDLE / Serving cell becomes non-suitable	Х	Х
6.2.3.1	Inter-RAT cell reselection / From E-UTRA RRC_IDLE to GSM_Idle/GPRS Packet_Idle	Х	Х
6.2.3.3	Inter-RAT cell reselection/From UTRA_Idle to E-UTRA RRC_IDLE	X	X
6.2.3.4	Inter-RAT cell reselection / From UTRA CELL_PCH state to E-UTRA RRC_IDLE	X	
6.2.3.5	Inter-RAT cell reselection/From E-UTRA RRC_IDLE to UTRA_Idle	X	Y
6.2.3.6	Inter-RAT cell reselection / From E-UTRA RRC_IDLE to UTRA_Idle according to RAT	X	X
6.2.3.7	priority provided by dedicated signalling Inter-RAT cell reselection / From E-UTRA RRC_IDLE to HRPD Idle / HRPD cell is higher	Х	
6.2.3.7a	Inter-RAT cell reselection / From E-UTRA RRC_IDLE to HRPD Idle / HRPD cell is higher	Х	
6.2.3.8	reselection priority than E-UTRA (Srxlev > ThreshX, HighP) Inter-RAT cell reselection / From E-UTRA RRC_IDLE to HRPD Idle / HRPD cell is lower	Х	
6.2.3.8a	reselection priority than E-UTRA Inter-RAT cell reselection / From E-UTRA RRC_IDLE to HRPD Idle / HRPD cell is lower	X	
	reselection priority than E-UTRA (Squal < ThreshServing, LowQ and Srxlev > ThreshX, LowP)		
6.2.3.9	Inter-RAT cell reselection / From E-UTRA RRC_IDLE to 1xRTT Dormant / 1xRTT cell is higher reselection priority than E-UTRA	Х	
6.2.3.9a	Inter-RAT cell reselection / From E-UTRA RRC_IDLE to 1xRTT Dormant / 1xRTT cell is higher reselection priority than E-UTRA (Srxlev > ThreshX, HighP)	Х	
6.2.3.10	Inter-RAT cell reselection / From E-UTRA RRC_IDLE to 1xRTT Dormant / 1xRTT cell is lower reselection priority than E-UTRA	Х	
6.2.3.10a	Inter-RAT cell reselection / From E-UTRA RRC_IDLE to 1xRTT Dormant / 1xRTT cell is lower reselection priority than E-UTRA (Squal < ThreshServing, LowQ and Srxlev > ThreshX, LowP)	Х	
6.2.3.13	Inter-RAT cell reselection / From UTRA_Idle to E-UTRA RRC_IDLE according to RAT	Х	Х
6.2.3.14	priority provided by dedicated signalling Inter-RAT cell reselection / From GSM_Idle/GPRS Packet_Idle to E-UTRA / Priority of E-UTRA cells are higher than the serving cell	Х	Х
6.2.3.15	Inter-RAT cells are ligher than the serving cell Inter-RAT cells are lower than the serving cell UTRA cells are lower than the serving cell	Х	Х
6.2.3.16	Inter-RAT cell reselection / From GSM_Idle to E-UTRAN /based on H_PRIO criteria	Х	Χ

Test case	Description	FDD	TDD
6.2.3.17	Inter-RAT cell reselection / From GSM_Idle/GPRS Packet_Idle to E-UTRA / Priority E-UTRA	Χ	Х
	cells		
6.2.3.18	Inter-RAT cell reselection / From GSM_Idle/GPRS Packet_Idle to E-UTRA / Blacklisted E-	Χ	Χ
6.2.3.19	UTRA cells Inter-RAT cell redirection to E-UTRA cell from GSM TCH mode		
6.2.3.20	Inter-RAT cell redirection to E-01RA cell from GSM TCH mode and no suitable cell	X	X
0.2.3.20	available	^	^
6.2.3.21	Inter-RAT autonomous cell reselection GPRS Packet_transfer NC0 mode to E-UTRA	Χ	Χ
6.2.3.24	Inter-RAT cell reselection from GPRS Packet_transfer to E-UTRA in CCN mode / PACKET	Χ	
	CELL CHANGE ORDER		
6.2.3.31	Inter-RAT cell reselection / From UTRA_Idle (low priority) to E-UTRA RRC_IDLE (high	Χ	Χ
0.0.00	priority) according to RAT priority provided by dedicated signalling		
6.2.3.32 6.3.1	Inter-RAT cell re-selection / From E-UTRA RRC_IDLE to UTRA_Idle, Snonintrasearch Inter-frequency cell reselection / From E-UTRA RRC_IDLE non-CSG cell to E-UTRA	X	Х
0.3.1	RRC_IDLE CSG cell	^	
6.3.5	Manual support for CSG ID selection	Χ	
6.3.6	Ignoring CSG cells in cell selection/reselection when allowed CSG list is empty or not	X	Х
	supported		
6.4.1	Manual CSG ID selection / Hybrid cell whose CSG ID is not in the Allowed CSG list nor	Χ	
	Operator's list		
7.1.1.1	CCCH mapped to UL SCH/ DL-SCH/Reserved LCID (Logical Channel ID)	Χ	Χ
7.1.1.2	DTCH or DCCH mapped to UL SCH/ DL-SCH/Reserved Logical Channel ID	Χ	X
7.1.2.1	Correct selection of RACH parameters/Random access preamble and PRACH resource	Х	Χ
7.1.2.2	explicitly signalled to the UE by RRC/Non-contention based random access procedure	Х	Х
7.1.2.2	Correct selection of RACH parameters/Random access preamble and PRACH resource explicitly signalled to the UE in PDCCH Order/Non-contention based random access	^	Α
	procedure		
7.1.2.3	Correct selection of RACH parameters/Preamble selected by MAC itself/Contention based	Х	Х
	random access procedure	,,	,,
7.1.2.4	Random access procedure/Successful	Х	Χ
7.1.2.5	Random access procedure/MAC PDU containing multiple RARs	Χ	Х
7.1.2.6	Maintenance of uplink time alignment	Χ	Х
7.1.2.7	MAC contention resolution/Temporary C-RNTI	Χ	Χ
7.1.2.8	MAC contention resolution/C-RNTI	Χ	Χ
7.1.2.9	MAC backoff indicator	Χ	Χ
7.1.3.1	Correct handling of DL assignment/Dynamic case	Χ	Χ
7.1.3.2	Correct handling of DL assignment / Semi-persistent case	Χ	Х
7.1.3.3	MAC PDU header handling	X	X
7.1.3.4	Correct HARQ process handling/DCCH and DTCH	X	X
7.1.3.5	Correct HARQ process handling/CCCH Correct HARQ process handling/BCCH	X	X
7.1.3.6 7.1.3.7	MAC padding	X	X
7.1.3.7	MAC reset DL	X	X
7.1.4.1	Correct handling of UL assignment/Dynamic case	X	X
7.1.4.2	Correct handling of UL assignment / Semi-persistent case	X	
7.1.4.3	Logical channel prioritization handling	X	Х
7.1.4.4	Correct handling of MAC control information/Scheduling requests and PUCCH	Χ	Χ
7.1.4.5	Correct handling of MAC control information/Scheduling requests and random access	X	X
	procedure		
7.1.4.6	Correct handling of MAC control information/Buffer status/UL data arrive in the UE Tx buffer	Χ	Χ
	and retransmission of BSR/Regular BSR		
7.1.4.7	Correct handling of MAC control information/Buffer Status/UL resources are	Χ	Χ
	allocated/Padding BSR		
7.1.4.7a	Correct handling of MAC control information / Buffer Status / UL resources are allocated /	Χ	Χ
7110	Cancellation of Padding BSR Correct handling of MAC control information/Buffer status/Periodic BSR timer expires	V	V
7.1.4.8 7.1.4.10	MAC padding	X	X
7.1.4.10	Correct HARQ process handling	X	X
7.1.4.11	MAC reset UL	X	X
7.1.4.12	MAC PDU header handling	X	X
		X	X
	Correct HARQ process handling / LII bundling		
7.1.4.14	Correct HARQ process handling / TTI bundling UE power headroom reporting/Periodic reporting		
	UE power headroom reporting/Periodic reporting UE power headroom Reporting/DL pathloss change reporting	X	X

Test case	Description	FDD	TDD
7.1.5.2	Predefined intra-TTI PUSCH hopping (N_sb=1)	Х	X

The Test Suite in TTCN3 is contained in multiple ASCII files which accompany the present document.

Annex B (informative): Style Guides

B.1 Introduction

This annex is based on the style guide given in TS 34.123-3 [7], annex E but the language for UE conformance tests is TTCN-3.

B.2 General Requirements for TTCN-3 Implementations

The TTCN-3 implementation for UE conformance tests shall be based on the following general design considerations:

- Even though it is not reflected in TTCN-3 anymore in UE conformance tests ASPs and PDUs will still be distinguished. This has impact on type definitions and naming conventions.
- In general, templates for UE conformance tests shall be separated for sending and receiving.
- Modified templates shall not be modified again.
- All local variables shall be declared at the beginning of a function;
 the order of declarations is:
 - local constants
 - local variables
 - local timers
- The purpose of the test case implementation is conformance testing.
- The common RAN5 approval process needs to be considered.

The TTCN-3 implementation for UE conformance tests shall fulfil the following requirements.

The implementation shall:

- follow ES 201 873-1 [13] (TTCN-3 Core Language) and ES 201 873-4 [27] (TTCN-3 Operational Semantics);
- be independent from interface specifications like TRI (ES 201 873-5 [28]) and TCI (ES 201 873-6 [29]) as well as from proprietary approaches;
- not use or rely on tool dependent features;
- support maintainability and extendibility;
- follow the naming conventions as defined below.

Further requirements:

- Usage of external functions should be avoided.
- Type definitions:
 - Existing ASN.1 type definitions contained in protocol specifications are imported from the respective standards. All other type definitions shall be done within TTCN-3.

B.3 Naming Conventions

Even though these are being used for TTCN-3 the naming conventions provided in the present document are mainly backward compatible to TTCN-2 as defined in TS 34.123-3 [7].

B.3.1 Prefixes and Restrictions for TTCN-3 Objects

Table B.3.1: Prefixes used for TTCN-3 objects

TTCN object	Initial Letter	Prefix/ Postfix	Comment
TTCN module	upper case	(none)	
TTCN group	upper case	(none)	
function parameter	upper case	p_	
function running on a component	upper case	f_	
local function (tree) not to be used by other modules	upper case	fl_	local function not to be used by other modules
external function	upper case	fx_	
altstep	upper case	a_	(including defaults)
test case selection expression			name as specified in TS 36.523-2 [2] shall be used
global constant	upper case	tsc_	(see note 1)
local constant	upper case	const_	local constant being defined in a function
Enumerated		(none)	there are no restrictions regarding enumerated types
type definition	upper case	_Type	(see note 7)
local variable	upper case	V_	(see note 6)
global (component) variable	upper case	VC_	(see note 2)
port type	upper case		
port name	upper case		
local timer	upper case	t_	
ASP template	upper case	cas_ cads_ car_ cadr_	send ASP modified (derived) send ASP receive ASP modified (derived) receive ASP
PDU template	upper case	cs_ cds_ cr_ cdr_	send PDU modified (derived) send PDU receive PDU modified (derived) receive PDU (see note 3)
CM template	upper case	cms_ cmr_	send coordination message receive coordination message
Template (neither ASP nor PDU nor CM)	upper case	cs_ cds_ cr_ cdr_ crs_	send template modified (derived) send template receive template modified (derived) receive template templates for IEs used in both directions (see note 5)
test suite parameter (PICS)	upper case	pc_	
test suite parameter (PIXIT)	upper case	px_	
test case		TC_	(see note 4)

- NOTE 1: Global constants may be defined differently in imported modules (e.g. without any prefix and with lower case initial letter).
- NOTE 2: Global variables or timers are those defined within the TTCN-3 components. They are visible to all the functions run in the component.
- NOTE 3: Base template may have a second prefix:
 - 508: PDU as defined in TS 36.508 [3];
 - 108: PDU as defined in TS 34.108 [8].
- NOTE 4: Test case names will correspond to the clause in the prose that specifies the test purpose. E.g. TC_8_1.
- NOTE 5: Applicable only in case of "quasi-constant" definitions, e.g. to define a (constant) random pattern to be used for sending and receiving when the UE is configured in loopback mode.
- NOTE 6: Counter variables do not need to have a prefix.
- NOTE 7: Exceptions for type definitions:
 - ASP names are fully upper case letters and typically have postfix "_REQ", "_CNF" or "_IND".
 - RRC protocol type definitions are extracted and imported from TS 36.331 [19]/TS 25.331 [36] and are therefore out of scope.
 - NAS protocol type definitions follow the names provided in the tabular notion of the standards and therefore do not have a "_Type" postfix.
- B.3.2 Void
- B.3.3 Void

B.3.4 Identifiers consisting of more than one Name

When identifiers are a concatenation of several words the words shall start with capital letters:

Further details are described in TS 34.123-3 [7], clause E.2.1.

B.4 Implementation Issues

B.4.1 Control part

Even though the control part may not be used in a test campaign but be overruled by the test management system it is used to provide the following information:

- All test cases contained in the test suite.
- For each test case:
 - Test case selection expression.

For maintenance reasons it shall be possible to generate the control part automatically by an appropriate tool.

B.4.2 Top Level Test Case Definitions

The top level test case definitions run on the MTC exclusively. The tasks of these test case definitions are generally the same for each test case:

- Start guard timer.
- Create PTCs.
- Connect PTCs.
- Start PTCs.

- Wait for PTCs having finished.

Additionally the MTC may host the upper tester but this is left open to implementation.

For maintenance reasons it shall be possible to generate the top level test case definitions defined for the MTC automatically by an appropriate tool. To achieve this, the name of a function to be started on particular PTC need derived from the test case name:

e.g. the function for PTC_A in test case TC_XX_YY_ZZ shall be f_TC_XX_YY_ZZ_A.

Cells are created in an off-state in the preambles of the corresponding PTCs while UE is in the switched off-state.

B.4.3 Inter Component Communication

Communication between PTCs or PTCs and the MTC can be done by messages or by build-in mechanisms as *done* and *kill*. For maintenance reasons and extendibility the inter component communication shall be encapsulated by TTCN-3 implementation.

B.4.4 Encoding Information

For UE conformance tests several encoding rules need to be applied by the TTCN-3 codec. Even though the codec is out of scope of the present document there are aspects with impact on TTCN-3 implementation depending on different type definitions.

Table B.4.4-1

Type definitions	Encoding			
ASN.1 types used for RRC signalling	ASN.1 PER			
ASN.1 types used by NAS protocols	ASN.1 BER			
NAS types	Tabular notated (see note)			
SMS Types	Tabular notated (see note)

TTCN-3 types not used at the air interface: - Configuration of system simulator				
 Coordination between components Types used internally in TTCN-3 	(no specific encoding required)			
NOTE: Tabular notated is performed by concatenation of all the present fields in the TTCN-3 template.				

Encoding information may be provided and supported in TTCN-3 by grouping of type definitions and using the *encode* attribute.

B.4.5 Verdict Assignment

In general the following rules shall be applied.

Table B.4.5-1: Rules for verdict assignment

Verdict	Rule
Pass	shall be assigned for each step defined in the prose of the test case
Fail	shall be assigned when there is a non-conformant signalling by the UE within the test body
shall be assigned outside the test body and when it is not unequivocal whether a misbeh	
Inconc	caused by non-conformity of the UE signalling
Error	In case of obvious programming or parameterisation errors (e.g. missing case in a select statement)

B.4.5.1 PASS verdict assignment

The PASS verdicts are assigned by test cases or test case specific functions.

For generic test procedures as specified in 36.508 cl. 6.4.2, the preliminary pass is assigned directly after the procedure if all described in the procedure UL messages have been successfully received; this allows re-usage of these procedures for other purposes.

B.4.5.2 FAIL or INCONC verdict assignment

The verdict FAIL or INCONC can be assigned in test cases, in the test case-specific function, in the common functions and in the default behaviour.

Test case or test case-specific function:

In normal cases the common function f_EUTRA_SetVerdictFailOrInconc shall be used to assign FAIL or INCONC depending on whether it is in the test body or outside of the body.

If in test cases a verdict FAIL shall be assigned for watchdog timer timeouts this needs to be done explicitly.

Common Functions:

The majority of the common functions have no verdict assignment. If a verdicts assignment is required in some common functions, the common function f_EUTRA_SetVerdictFailOrInconc shall be used to assign FAIL or INCONC.

As an exception in the altstep a_EUTRA_RacingCond_AwaitRrcMessage an INCONC is assigned when the RRC message and the L1/MAC indication are in the wrong order.

B.4.5.3 Verdict assignment in default behaviour

The default behaviour handles all events not being handled in test cases or functions. Whether the verdict FAIL or INCONC to be assigned in the default behaviour it depends very much on the port where the event occurs.

Table B.4.5.3-1: Verdict assignment in default behaviour upon test ports

Test port	Message	Comment	Verdict
SYS	SYSTEM_CTRL_CNF	unexpected confirmation	INCONC
SYSIND	SYSTEM_IND: Error indication	unspecific error at SS	INCONC
	SYSTEM_IND: MAC indication	(see note 1)	FAIL in the test body INCONC outside the test body
	SYSTEM_IND: L1 indication	RachPreamble, SchedReq, UL_HARQ may be repeated by the UE in case of transmission errors (see note 1)	INCONC
SRB	SRB_COMMON_IND	Any unexpected L3 signalling (see note 3)	FAIL in the test body INCONC outside the test body
NASCTRL	NAS_CTRL_CNF	unexpected confirmation	INCONC
DRB	DRB_COMMON_IND	L2 and combined tests (see note 2)	FAIL in the test body INCONC outside the test body
		pure signalling tests (see note 2)	INCONC
UT	UT_COMMON_CNF	unexpected confirmation	INCONC

NOTE 1: L1/MAC indications need to be enabled by the test case therefore they occur only when being relevant for the test case.

NOTE 2: L2 and combined tests can be distinguished from pure signalling tests by additional global information controlled by f EUTRA TestBody Set.

NOTE 3: Layer 3 signalling by definition covers NAS and RRC signalling i.e. in general unexpected RRC messages will cause a FAIL in the body of any NAS test case as well as unexpected NAS messages will cause a FAIL in the body of any RRC test case.

Table B.4.5.3-2: Verdict assignment in default behaviour when time-out

Timeout	Comment	Verdict			
any timer	unspecific timeout (see note)	INCONC			
IOTE: Local timers of test cases or functions cannot be distinguished in the default behaviour.					

B.4.6 Default Behaviour

As experience from UMTS conformance tests there shall be one standard default behaviour for each component.

The following rules shall be applied:

- The standard default behaviour is activated during initialisation of the respective component. In normal cases a TTCN writer does not need to care about the default.
- In general there is only one default behaviour activated (i.e. the standard default behaviour).
- The standard default behaviour shall cover all ports and timers of the component.
- Whenever possible deviations from the standard default behaviour shall be implemented locally rather than by introducing a new default behaviour.

If for exceptional cases the standard default behaviour needs to be replaced by another default behaviour or another default behaviour needs to be activated on top, the TTCN writer is responsible:

- to avoid side effects;
- to restore the standard behaviour.

B.4.7 Templates for Sending and Receiving

Templates used for sending and receiving shall be separated in general:

- A template shall be either for sending or for receiving; this shall be reflected in the prefix of the identifier.
- Send templates shall use no receive templates and vice versa.
- All parameters of a send template shall be restricted to:
 - values;
 - template (value);
 - template (omit).
- Parameters of receive templates may allow wildcards. They can be:
 - values;
 - unrestricted template parameters;
 - template parameters restricted to be present.
- The only exception to the above rule is for "quasi-constant" definitions, as described in note 5 of table B.3.1. Otherwise, even when the same data is expected for sending and receiving templates, there shall be different templates and the following rule shall be applied.
- The receive template is assigned the send template e.g.:
 - template My_Type cr_Template := cs_Template
- This results in separate definitions for sending and receiving and improves maintainability.

- NOTE 1: For maintenance reasons, a send template shall never be derived from a receive template; and also a receive template shall never be assigned to a send template.
- NOTE 2: When a send template is assigned to a receive template, the formal parameters of the receive template must follow the rules of send templates (i.e. it shall only contain 'template (value)', 'template (omit)' or values only).

B.4.8 Logging

In general no explicit log statements shall be used. As an exception log may be used to report unexpected situations in TTCN-3 like fatal programming error.

B.4.8.1 Prose Step Numbers

Informative comments containing the prose steps defined in 36.523-1 should be implemented according to the following guidelines:

- They relate to the Expected Sequence steps in the prose
- They should not be placed in common functions
- They should only be placed in functions containing the test case body
- They should always start with //@siclog
- They should always finish with siclog@
- For single steps they should be in the form //@siclog "Step 1" siclog@
- For multiple steps (where several steps are completed in a common function), they should be in the form //@siclog "Steps 1 3" siclog@ i.e. Steps, space, first number, space, dash, space, second number
- They should be placed as close as possible, but always BEFORE, the line send/receive/function call
- The step number should also be included in any pass/fail verdict specified in the test case body
- If the step is listed as Void (or a group of steps) in the expected sequence, include the word Void in the comment.

Therefore the format of the comment should be:

//@siclog "Step[s] X [- Y] [Void]" siclog@

B.4.9 Top level comments

No restriction is specified for the top level comments.

B.4.10 Mapping of DRBs

LTE DRBs are mapped in TTCN according to the following rules:

- DRB1 is exclusively reserved for the default DRB and hence is always AM
- additional DRBs (AM or UM) may be assigned from DRB2 onward in any order
- there shall be no reconfiguration of a DRB from AM to UM or vice versa (unless a test case explicitly requires this); this especially means that DRB1 is never reconfigured to UM
- in general at the SS all DRBs needed by a test case may be configured at the beginning of the test case.

B.5 Modularisation

Even though there are no specific rules how to apply modularisation in general some principles can be defined:

- Maintainability and extendibility:
 - Maintainability and extendibility are essential for definition of the modular structure.
- Granularity of modules:
 - Cyclic imports are forbidden in TTCN-3; this has impact on the extendibility:
 - The granularity of modules shall not be too small.
 - Too big modules are hard to handle and may cause increase of compilation time:
 - The granularity of modules shall not be too rough.

NOTE: These are only vague principles since there is no way to define what small or huge modules are.

- General module structure:
 - The following modularisation can be applied independent from the internal structure:
 - Type definitions: TTCN-3, ASN.1.
 - Component definitions.
 - Common Templates: component dependent, component independent.
 - Common behaviour: MTC, PTCs.
 - Test case specific templates.
 - Test case specific behaviour.
- Whether or how these module groups can further be sub-divided is implementation dependent and therefore out of scope of the present document.

Annex C (informative): Design Principles

C.1 ASP Design

All ASPs consist of a common part (defined as a TTCN-3 type) and a specific part.

All ASPs sent by the SS include timing information (SFN, subframe number) in the common part.

Only one ASP is defined per direction per port, but this ASP may contain a union of several sub-ASPs in the specific part.

In general a small number of common ASPs cover all functionality, although other ASPs may be introduced to simplify TTCN-3 implementation and improve readability. Recurrent SS changes, such as power level changes, security activation and MAC scheduling are handled in dedicated ASPs. In addition, special purpose ASPs are used to control special behaviour, for example in L2 tests.

Configuration ASPs re-use ASN.1 definitions defined in the core specs.

No encoding rules are specified for the configuration ASPs; how they are encoded is left up to the SS implementation.

Configuration ASPs are 'procedure-based', rather than 'protocol layer-based' and reflect the state transitions of the SS. The same ASPs are used for reconfiguration and for initial configuration. In the case of reconfiguration the semantics of omit is to keep the configuration as it is; therefore when an IE in a configuration may be left out this is done e.g. by setting the respective field to a special value "None".

Data ASPs for sending/receiving peer-to-peer PDUs and user data all have different ASPs for the different SAPs.

The common part includes (at least):

- Timing Info:
 - SFN.
 - Subframe number (optional).
 - Which timing to use will depend on the test procedure and ASP purpose.
- Control Info:
 - Confirmation Flag.

The RRC ASN.1 IEs used in the specific part of the configuration ASPs:

- are imported using the granularity at the channel structure level or below;
- allow the ASP to be organised according to SS requirements;
- have a name that relates to SS configuration.

The SS specific IEs used in the specific part of the configuration ASPs (i.e. those elements not imported from the RRC ASN.1):

- use a naming convention such that they are easily distinguishable from the RRC ASN.1 IEs;
- are defined in TTCN-3 (i.e. not in ASN.1).

C.2 SS State Model

Figure C.2 shows the basic SS state model. It is basic in the sense that internally the SS may have more states; however, (re)configuration actions (state transitions in the model) should cause the SS to transit between the states defined below.

The following assumptions have been made about this state model:

- It presents a model of states in scope of a single cell. Hence, all configuration activities shall be performed in scope of a single cell.
- It depicts only SS states and SS (re)configuration actions between these states:
 - It does not show events which may trigger state transitions, e.g. L3 messages or procedures i.e. it is test case and L3 procedure agnostic.
 - It does not show any peer-to-peer (i.e. between SS and UE) messages.
- Triggers for state transitions are always SS configuration messages (ASPs) coming from the test suite:
 - L2 messages coming from the UE can only trigger internal SS sub-state transitions and semi-autonomous procedures.
- L1 and L2 procedures (e.g. random access procedure, scheduling, security activation steps) are semi-autonomously handled by the SS and after being pre-configured do not require interaction with the test case:
 - The majority of test cases do not need to worry about e.g. RA procedure and letting the SS handle it would greatly simplify test case definition and implementation.
 - There may be stringent time requirements in case of some procedures that can be hard to meet in a generic way in the test suite.
 - Semi-autonomous procedures should be flexibly configurable and should have a "manual" mode in which they are handled by the test suite in order to enable testing them. What is the desired level and way of control is FFS.

Most states are stationary states, i.e. the SS can stay in them for a long time or, after performing some procedures, returns to these states. However, there is one state (indicated by dashed lines) which is part of the AS security activation procedure and is transitional, i.e. the SS can only stay in it for a short time until a transition the next stationary state is triggered.

To make the diagram more readable, a separate state called *ANY_STATE* has been introduced, together with some transitions. It shows which transitions are allowed at any point of time in any state.

Figure C.2-1: Basic SS state model

Description of states.

Table C.2-1: Description of states

State	Description
NOT_CONFIGURED	The cell does not exist (is not configured) in the SS
CELL_BROADCASTING	Physical DL channels and signals configured
	Initial cell configuration done: freq, BW, antennas, MIMO mode, power, etc.
	Transport and logical channels configured for SI broadcast
	Cell is broadcasting SI and downlink signals
	NOTE 1: This type of cell is needed only to serve as a neighbouring cell for
	measurement purposes, where full cell configuration does not need to be
	specified. There is no need to be able to promote a broadcasting cell to a
	full cell.
	NOTE 2: It is currently open whether a separate cell type with limited
	PRACH/RACH Rx capability is needed - this depends on whether a
	justified use case is defined for such a cell type.
CELL_ACTIVE	Cell configured to send and receive data from UE (fully functional)
	SRB0 defined (default configuration specified in TS 36.508 [3])
	SRB1 defined (default configuration specified in TS 36.508 [3])
AS_SECURITY_ACTIVE	The SS has AS security (integrity protection and ciphering) active
	NOTE 3: The SS needs to autonomously take care of a temporary state in which
	integrity protection is applied to an outgoing SMC message, but ciphering
	is not.
RBS_ACTIVE	SRB2 and/or DRBs are configured for the UE (in addition to SRB0 and SRB1)
ANY_STATE	Represents any of the above states (except NOT_CONFIGURED)

Annex D (informative): TTCN-3 Definitions

D.1 EUTRA_ASP_TypeDefs

Type definitions for configuration of the system simulator;

Common design principles:

Semantics of OMIT: for all TTCN-3 type definitions used in ASPs omit means "keep as it is" =>

- on initial configuration in general all fields shall be provided
- no default values for fields are foreseen
- if necessary non-existence of information shall be explicitly configured (e.g. with a union of "no configuration" and "configuration parameters"
- fields within structures imported from the core spec are excepted from this rule

D.1.1 ASN1_Container

Definitions containing ASN.1 types for backward compatibility;

NOTE 1: PCCH_Message and BCCH_DL_SCH_Message already have a critical extension mechanism by RRC type definition

NOTE 2: BCCH BCH Message contains the MIB and therefore is considered to be not extendable

NOTE 3: "simple types" are not considered: C_RNTI, PhysCellId, CellIdentity, ARFCN_ValueEUTRA

D.1.2 System_Configuration

Formal ASP Definitions for system configuration

SystemRequest_Type

TTCN-3 Union T	уре	
Name	SystemRequest_Type	
Comment		
Cell	CellConfigRequest Type	configure/release a cell
CellAttenuation List	CellAttenuationList Type	power attenuation for one or several cells; all cells included in the list shall be changed at the same time; all cells in the list shall reach the new cell power within a maximum of 100ms (10 frames) acc. to the tolerances given in TS 36.508 NOTE: In the common ASP part the CellId shall be set - to the cell the timing information refers to if activation time shall be applied - to eutra_Cell_NonSpecific when there is no activation time
RadioBearerLis t	RadioBearerList_Type	configure/release one or several SRBs and/or DRBs
EnquireTiming	Null Type	get SFN and sub-frame number for this cell
AS_Security	AS Security Type	StartRestart/Release of AS security
Sps	SpsConfig Type	to configure/activate or release semi-persistent scheduling
Paging	PagingTrigger Type	to trigger SS to send paging at the given paging occasion (as calculated in TTCN)
L1MacIndCtrl	L1Mac_IndicationControl_Type	to configure SS to generate indications for L1/MAC events
RIcIndCtrl	Rlc_IndicationControl_Type	to configure SS to generate indications for RLC events
PdcpCount	PDCP CountReq Type	to set or enquire PDCP COUNT for one ore more RBs
PdcpHandover Control	PDCP HandoverControlReq Typ e	to inform the target cell about the handover
L1_TestMode	L1_TestMode_Type	To Set L1/MAC in special Test modes eg. DL CRC, PHICH etc
PdcchOrder	RA PDCCH Order Type	to configure SS to transmit a PDCCH order with configured C-RNTI to the UE to trigger RA procedure; result in DCI Format 1A transmission as in TS 36.212, clause 5.3.3.1.3

SystemConfirm_Type

TTCN-3 Union T	TTCN-3 Union Type

L1MacIndCtrl	Null_Type	(no further parameters from SS)		
RIcIndCtrl	Null_Type	(no further parameters from SS)		
PdcpCount	PDCP CountCnf Type	as response to 'Get' a list is returned containing COUNT		
		information for the requested RBs		
PdcpHandover	Null Type	confirmation for PDCP handover control		
Control				
L1_TestMode	Null Type	confirmation for L1 test mode		
PdcchOrder	Null_Type	confirmation for PDCCH Order		

SystemIndication_Type

TTCN-3 Union	Туре	
Name	SystemIndication_Type	
Comment		
Error	charstring	indicates an error situation in SS; is not explicitly handled in TTCN but causes an INCONC due to default behaviour; an additional error code can be signalled in the common part of the ASP; SS shall raise an error in case of Invalid TimingInfo for TDD Contradiction of periodic UL grants and TDD configuration Data scheduled for the same TTI does not fit into an available transport block (NOTE: additional cases may occur)
RachPreamble	RachPreamble_Type	RACH preamble being sent by the UE
SchedReg	Null Type	indication for scheduling request sent by the UE
BSR	BSR Type	to report the Buffer status report being received
UL_HARQ	HARQ Type	to report the UL HARQ as received on PUCCH[TTI] for corresponding DL transmission in TTI-x, where x is normally 4
C_RNTI	C_RNTI	indicates C-RNTI being contained in a MAC PDU sent by the UE
PHR	PHR_Type	to report the Power headroom report received
HarqError	HarqError Type	indicates detection of HARQ error: 1. HARQ CRC error for UL data 2. HARQ NACK from the UE unless SS is configured to report HARQ ACK/NACK
RlcDiscardInd	RlcDiscardInd_Type	indicates e.g. discarded PDUs
PeriodicRI	RI_Type	indicates periodic Rank Indicator (RI) reported by the UE on PUCCH or PUSCH; periodic CQI/PMI/RI Reporting is semi-statically configured at the UE by higher layers (see TS 36.213 clause 7.2.2); aperiodic reporting acc. to TS 36.213 clause 7.2.1 shall not be indicated NOTE: Acc. to TS 36.213 clause 7.2 aperiodic reporting has higher precedence than periodic reporting; => as working assumption the CQI request field in DCI format 0 is expected to be 0 for UL grants assigned by the SS i.e. aperiodic reporting acc. to TS 213 clause 7.2.1 does not happen

Comment		
Value	ImcsValue Type	
NotUsed	Null Type	

ULGrant_Period_Type

TTCN-3 Union T	⁻ уре	
Name	ULGrant_Period_Type	
Comment		
OnlyOnce	Null Type	grant is sent out only once; no period
Duration	integer (1infinity)	duration of the grant period (TTI=1ms); for TDD the starting time and periodicity need to be chosen in TTCN so that the grants are assigned at valid subframes only; otherwise SS shall raise an error

TransmissionRepetition_Type

TTCN-3 Union Type		
Name	TransmissionRepetition_Type	
Comment		
Continuous	Null Type	
NumOfCycles	integer (1infinity)	

PUCCH_AutoSynch_Type

TTCN-3 Record	TTCN-3 Record Type		
Name	PUCCH_AutoSynch_Type		
Comment			
TimingAdvance	TimingAdvanceIndex Type		
TA_Period	TimingAdvance Period Ty pe	time period after which TA MAC control elements need to be automatically transmitted	
TA_Repetition	TransmissionRepetition_Ty pe	number of TA MAC control element repetitions to be automatically transmitted or 'Continuous'	

PUCCH_Synch_Type

TTCN-3 Union Type		
Name	PUCCH_Synch_Type	
Comment		
None	Null_Type	no PUCCH Synchronisation applied
Auto	PUCCH_AutoSynch_Type	SS automatically maintains PUCCH synchronization at UE

${\bf FreqDomainSchedulCommon_Type}$

TTCN-3 Record Type			
Name	FreqDomainSchedulCommon_Ty	FreqDomainSchedulCommon_Type	
Comment	common type to specify restrictions for frequency domain scheduling by a start index and a maximum range of RBs; in general the resource allocation refers to virtual resource blocks: - format 1A (localised): FirstRbIndex refers to the first physical RB; the RBs are subsequent (upto MaxRbCnt RBs); may be applied for all kind of channels - format 1C (distributed): FirstRbIndex refers to the first virtual RB; the virtual RBs are subsequent (upto MaxRbCnt RBs) but mapped (distributed) to physical resource; typically applied on BCCH, PCCH and RAR - format 1 (localised): FirstRbIndex refers to the first physical RB; RBs are not consecutive; SS needs to provided bitmap of RBs (see TS 36.523-3) to cope with mapping of virtual resource allocation (format 1C) applied on other channels; typically there are either - all channels having format 1A (localised) - BCCH, PCCH and RAR having format 1C (distributed) + DTCH/DCCH having format 1		
FirstRbIndex	integer	index of the first (vitual) resource block in frequency domain; 0 N(UL/DL, RB) - 1; NOTE: DCI format 1C refers to a virtual RB allocation i.e. the resource block index; differs from the physical resource allocation where the RBs are distributed over the whole frequency bandwidth (TS 36.213, clause 7.1.6.3)	
MaxRbCnt	integer	max. number of resource blocks to be assigned; FirstRbIndex + MaxRbCnt <= N(UL/DL, RB); SS shall not assigned more than the given resource blocks to the respective channel (i.e. MaxRbCnt is the upper bound); if the the configuration for a channel exceeds the total bandwidth this is a TTCN error (=> SS shall raise an error)	

FreqDomainSchedulExplicit_Type

TTCN-3 Record Type			
Name	FreqDomainSchedulExplicit_Type		
Comment	type used for explicit DL scheduling; Nprb is the exact nunber of RBs whereas in FreqDomainSchedulCommon_Type MaxRbCnt is the upper bound		
FirstRbIndex	integer index of the first resource block in frequency domain; 0 N(UL/DL, RB) - 1		
Nprb	integer		number of resource blocks to be assigned;

Comment	additional information for DL I	OCI in	case of MIMO (i.e. when a 2nd CW is specified)
RedundancyVe rsionList_2ndC W	RedundancyVersionListDL Type	opt	list of Redundancy version for 2nd code word; shall have the same length as RedundancyVersionList_1stCW; if omit, for the 2nd CW the same RedundancyVersionList shall be applied as for the 1st CW
CodeWordSwa pFlag	B1 Type		transport block to codeword mapping acc. to TS 36.212 Table 5.3.3.1.5-1
PrecodingBits	MIMO PrecodingBits Type		precoding information acc. TS 36.212, table 5.3.3.1.5-3 and 5.3.3.1.5A-1

DciDlInfoCommon_Type

TTCN-3 Record Type			
Name	DciDlInfoCommon_Type		
Comment	used for normal DL scheduling acc. to TS 36.523-3, clause 7.3		
Format	PdcchDciFormat Type	BCCH, PCCH and RACH Response: 1A or 1C (TS 36.213, clause 7.1) CCCH: 1A since transmission mode is not (may not be) configured at the UE yet (TS 36.213, clause 7.1) DTCH/DCCH: depending on transmission mode	
ResourceAlloc	PdcchResourceAllocation_	depends on DCI format, e.g. ra_2_Localised or	
Туре	<u>Type</u>	ra_2_Distributed for DCI format 1A	
Modulation_1st CW	Modulation Type	max. modulation scheme for the 1st code word; depending on the amount of data a lower modulation scheme may be by SS but not a higher one; BCCH, PCCH and RACH Response: QPSK only	
Modulation_2n dCW	Modulation Type	modulation scheme for 2nd code word in case of spatial multiplexing; can be different than 1st code word (see TS 36.211, clause 6.3.2; TS 36.212, clause 5.3.3.1.5); 'unused' when there is no spatial multiplexing; NOTE: Acc. to 36.523-3 cl. 7.3.3.4 in normal mode MIMO shall not be used => for the time being Modulation_2ndCW is always "unused"	
FreqDomainSc hedul	FreqDomainSchedulComm on Type	index of 1st RB; max. number of RBs per TTI; NOTE: in case of DCI format 1C the first RB index has no meaning since distributed virtual resource blocks assigned in this case (TS 36.213, clause 7.1.6.3)	
RedundancyVe rsionList	RedundancyVersionListDL Type	list of Redundancy version to be used in case of retransmission; the number of elements in the list provides the maxHARQ-Tx	

DciDlInfoExplicit_Type

TTCN-3 Record Type			
Name	DciDlInfoExplicit_Type		
Comment	used for explicit DL schedulin	g acc.	to TS 36.523-3, clause 7.3
Imcs_1stCW	Imcs_Type		MCS index of table 7.1.7.1-1 of TS 36.213
Imcs_2ndCW	Imcs_Type		MCS index for the 2nd code word in case of MIMO;
			'NotUsed' when MIMO is not used
Format	PdcchDciFormat Type		
ResourceAlloc	PdcchResourceAllocation_		
Type	Type		
FreqDomainSc	<u>FreqDomainSchedulExplicit</u>		
hedul	<u>Type</u>		
RedundancyVe	RedundancyVersionListDL		list of Redundancy version to be used in case of retransmission
rsionList	Type		the number of elements in the list provides the maxHARQ-Tx
MimoInfo	MIMO DciDIInfo Type	opt	shall be present when Imcs_2ndCW specifies a 2nd CW to be
			used;
			shall be omit when Imcs_2ndCW is 'NotUsed'

DciDlInfo_Type

TTCN-3 Union T	TTCN-3 Union Type			
Name	DciDIInfo_Type			
Comment				
Auto	DciDlInfoCommon Type	SS shall chose the appropriate TBS up to the maximim number of resource blocks		
Explicit	DciDlInfoExplicit_Type	used in MAC or RAB tests where exact TBS needs to be specified		

DciUlInfo_Type

TTCN-3 Record Type			
Name	DciUlInfo_Type		
Comment			
Imcs	Imcs Type	MCS index of table 8.6.1-1 of TS 36.213	
TransRetransm issionList	UL TransRetransmissionList Type	list of possible retransmissions and their redundancy versions (depending on being adapive or non-adaptive); the list shall - start with - "New Transmission" (normal case) or - "Adaptive Retransmission" (e.g. to request a retransmission even when the data has been acknowledged with a HARQ ACK) - end with "Adaptive Retransmission" (if there are retransmissions) NOTE1: TTCN implementation shall ensure that a reconfiguration is done not before the previous list has been fully processed NOTE2: for normal operation the list contains only one NewTransmission element (i.e. possible retransmissions are non-adaptive)	
FreqDomainSc	FreqDomainSchedulExplicit	<u> </u>	
hedul	<u>Type</u>		

PeriodicGrant_Type

TTCN-3 Record Type			
Name	PeriodicGrant_Type		
Comment			
Period	ULGrant Period Type		time period after which UL Grant need to be automatically
			transmitted or 'OnlyOnce'
NoOfRepetition	TransmissionRepetition_Ty		number of UL Grant repetitions to be automatically transmitted or
S	<u>pe</u>		continuous repetition

UL_GrantConfig_Type

TTCN-3 Union T	уре	
Name	UL_GrantConfig_Type	
Comment		
OnSR_Recepti on	Null Type	SS tranmits UL Grant as configured by CommonDciInfoUL_Type at every reception of SR; to be used in non L2 Test
Periodic	PeriodicGrant_Type	SS tranmits UL Grant as configured by CommonDciInfoUL_Type periodically; to be used in L2 tests; MAC tests testing Grants might set the period as infinite and num grant as 1
None	Null Type	disable any grant transmission

D.1.3.5 Random_Access_Procedure

EUTRA_ASP_TypeDefs: Constant Definitions

TTCN-3 Basic Types					
tsc_RandomAccess ResponseListSize	integer	10	arbitrary value (needs to be extended, if necessary); in case of RACH in idle, UE will keep on making RACH attempts until t300 expires => number of PRACH preambles maybe even greater than maximum value of PREAMBLE_TRANS_MAX		

Random_Access_Procedure: Basic Type Definitions

TTCN-3 Basic Types		
RACH_TimingAdvance_T	integer (02047)	11 bit timing advance as used in RACH
уре		response (absolute value)

UplinkGrant_Type

TTCN-3 Record	TTCN-3 Record Type		
Name	UplinkGrant_Type		
Comment	TS 36.213, clause 6.2		
HoppingFlag	B1 Type	Hopping flag	
RB_Allocation	B10 Type	Fixed size resource block assignment	
ModAndCodSc	B4 Type	Truncated modulation and coding scheme	
heme			
TPC_Comman	B3 Type	TPC command for scheduled PUSCH	
d			
UL_Delay	B1 Type	UL delay	
CQI_Req	B1 Type	CQI request	

$Contention Resolution_Contained RIcPdu_Type$

TTCN-3 Union Type			
Name	ContentionResolution	ContentionResolution_ContainedRlcPdu_Type	
Comment			
RlcPdu	octetstring	octetstring of an RLC PDU containing e.g. the RRC Connection Setup; to be sent in the same MAC PDU as the MAC Contention Resolution Control Element	
None	Null_Type	MAC PDU containing the MAC Contention Resolution Control Element does not contain an RLC PDU (i.e. RRC Connection Setup is sent in another PDU)	

ContentionResolution_ContainedId_Type

TTCN-3 Union Type		
Name	ContentionResolution_ContainedId_Type	
Comment		
XorMask	ContentionResolutionId Type	When SS receives Contention Resolution ID from the UE, SS shall XOR it with the given mask and use this as Contention Resolution ID; this allows to get an unmatching Contention Resolution ID; in normal cases mask shall be set to tsc_ContentionResolutionId_Unchanged (i.e. the Contention Resolution ID remains unchanged)
None	Null_Type	MAC Contention Resolution Control Element is not contained in the MAC PDU sent out as response on Msg3

TCRNTI_ContentionResolutionMacPdu_Type

TTCN-3 Record	TTCN-3 Record Type		
Name	TCRNTI_ContentionResolutionMacPdu_Type		
Comment	NOTE:		
	Either ContainedId or Contain	edRlc	Pdu (or both) shall not be 'none';
	(if no Contention Resolution N	lac Po	du shall be sent,
	TCRNTI_ContentionResolution	nCtrl_	Type.NoContResolID shall be used instead)
ContainedId	ContentionResolution Cont		Either the Contention Resolution ID as received from the UE
	ainedId_Type		or a modified Contention Resolution ID (XorMask !=
			tsc_ContentionResolutionId_Unchanged)
			or no Contention Resolution ID at all
ContainedRlcP	ContentionResolution Cont		the MAC PDU containing the MAC Contention Resolution Control
du	ainedRlcPdu_Type		Element may contain the RRC Connection Setup;
			in this case the RRC PDU shall be completely encoded been
			contained in an RLC PDU

$TCRNTI_ContentionResolutionCtrl_Type$

TTCN-3 Union Type			
Name	TCRNTI_ContentionResolutionCtrl_Type		
Comment	when the UE responds on a Random Access Response with a RRC Connection Request on CCCH and not with a C-RNTI SS shall assume initial Random Access Procedure (TS 36.300, clause 10.1.5.1), i.e. sends a ContentionResolutionId back to the UE		
MacPdu	TCRNTI ContentionResolutionMa cPdu_Type	MAC PDU containing the Contention Resolution ID and optionally an RRC PDU (RRC Connection Setup)	
MacPdu_CRC_	TCRNTI ContentionResolutionMa	same as MacPdu (see above),	
Error	<u>cPdu Type</u>	but SS shall generate CRC error by toggling CRC bits;	
		no retransmissions shall be made as UE shall not send a NACK	
NoContResolID	Null_Type	SS shall not include contention resolution ID (i.e. no MAC PDU	
		shall be sent);	
		used for contention resolution fail case	

${\tt CRNTI_ContentionResolutionCtrl_Type}$

TTCN-3 Union T	TTCN-3 Union Type		
Name	CRNTI_ContentionResolutionCtrl_Type		
Comment	configuration for Random Access Procedure in RRC_CONNECTED (see TS 36.300, clause 10.1.5.1); when SS receives C-RNTI MAC element sent by the UE after Random Access Response, SS shall deal with the C-RNTI as specified in this structure		
AutomaticGrant	DciUlInfo Type	before expiry of the contention resolution timer SS shall automatically address PDCCH using C-RNTI as sent by the UE; the UL grant is specified acc. to DciUlInfo_Type	
None	Null Type	Used in case of dedicated preamble transmission or to simulate failure cases; SS shall not address PDCCH using C-RNTI => expiry of contention resolution timer on UE side	

ContentionResolutionCtrl_Type

TTCN-3 Union Type			
Name	ContentionResolutionCtrl_Type		
Comment	NOTE: SS only needs to consider one kind of contention resolution at one time; in the initial configuration of a cell TCRNTI_Based shall be configured and the common assuption is that in RRC_CONNECTED normally there are no RACH procedures (i.e. no CRNTI_Based configuration needed)		
		cenarios CRNTI_Based shall be configured	
TCRNTI_Base	TCRNTI_ContentionResolutionCtr	TCRNTI based contention resolution (e.g. initial access),	
d	<u>I Type</u>	hence involves inclusion contention resolution identity in DL	
		message 4 of RACH procedure	
CRNTI_Based	CRNTI_ContentionResolutionCtrl	CRNTI based contention resolution (e.g. in case UE is being in	
	<u>Type</u>	RRC_CONNECTED):	
		hence uplink message in step 3 (of RACH procedure) is followed by PDCCH transmission with UE C-RNTI to end procedure	

RapIdCtrl_Type

TTCN-3 Union	TTCN-3 Union Type		
Name	RapIdCtrl_Type		
Comment			
Automatic	Null_Type	SS shall automatically use same RAPID as received from the UE	
Unmatched	Null Type	SS shall use RAPID being different from preamble sent by the UE; SS shall calculate this RAPID acc. to RAPID := (RAPID + 363) mod 64 if single RAR is transmitted in a MAC PDU then only 3 is added if multiple RAR's are transmitted in MAC PDU, then for first unmatched RAR 3 is added, second unmatched 4 is added, third unmatched 5 is added and so on	

TempC_RNTI_Type

TTCN-3 Union Type		
Name	TempC_RNTI_Type	
Comment		
SameAsC_RN TI	Null Type	in the RA response SS shall use the same C-RNTI as configured in ActiveCellConfig_Type; this is useful for initial random access
Explicit	C_RNTI	in the RA response SS shall use different value as configured in ActiveCellConfig_Type; this can be used when the UE already is in RRC_CONNECTED to have a temporary C-RNTI different from the one used by the UE; NOTE: when the UE is not in RRC_CONNECTED there shall be no explicit temp. C-RNTI since then the UE would assume this value as C-RNTI

$Random Access Response Parameters_Type$

TTCN-3 Record	Туре		
Name	RandomAccessResponseParameters_Type		
Comment	paramenters to control conten	t of RAR sent to the UE	
Rapld	RapIdCtrl_Type	to control Random Access Preamble Id to be sent back to the UE; used in RAR MAC sub-header	
InitialGrant	UplinkGrant Type	initial UL grant	
TimingAdvance	RACH TimingAdvance Ty pe	timing advance: granularity of 0.52 micro sec (16*Ts); see TS 36.300, clause 5.2.7.3, TS 36.321, clause 6.1.3.5; NOTE: timing advance has impact not only on the RA procedure; SS in general needs to adjust its timing accordingly	
TempC_RNTI	TempC RNTI Type	NOTE: For initial Random Access Procedure at network (SS) side there is no temporary C-RNTI: network assigns the C-RNTI which is used by any UE as being temporary; the UE which 'wins' the contention resolution keeps the (temporary) C-RNTI; other UEs need to repeat the RACH procedure; => at the SS the TempC_RNTI shall be 'SameAsC_RNTI' For Random Access Procedure in RRC_CONNECTED state the NW assigns a temporary C-RNTI which is replaced by the one stored at the UE; => TempC_RNTI may be 'SameAsC_RNTI' (in this case temp. C-RNTI and C-RNTI are equal what is not likely in a real network), or there is an explicit temp. C-RNTI what is used during RA procedure only (as in a real network)	

RarList_Type

TTCN-3 Record of Type		
Name	RarList_Type	
Comment	in general MAC PDU may contain one or several RARs;	
normally only one RAR is contained		
record of RandomAccessResponseParameters Type		

$Random Access Response_Type$

TTCN-3 Union Type			
Name	RandomAccessResponse_Type		
Comment			
None	Null Type	used for unsuccessful RA procedure	
List	RarList Type	normally one RAR to be sent to the UE; in general there can be	
		more than one RAR	

$Random Access Back of fIndicator_Type$

TTCN-3 Union Type			
Name	RandomAccessBackoffIndicator_Type		
Comment			
None	Null_Type	normal case, no back off indicator included	
Index	integer (015)	Backoff Parameter values acc. TS 36.321, clause 7.2;	
		values 012 are defined, 1315 may be used in error case	

RandomAccessResponseCtrl_Type

TTCN-3 Reco	TTCN-3 Record Type		
Name	RandomAccessResponseCtrl_Type		
Comment	configuration for Random Access Response mapped to DL-SCH mapped to PDSCH TransmissionMode: single antenna mode when there is only one antenna configured, transmit diversit else; RNTI: RA-RNTI (TS 36.321, clause 7.1); if both RAR msg and backoff indicator are 'None' SS shall not respond on RAP		
Dcilnfo	DciDlInfoCommon_Type	DCI format: 1A or 1C (TS 36.213, clause 7.1) ResourceAllocType: 2 (acc. to DCI format) Modulation: QPSK Frequency domain schedule: index of 1st RB; max. number of RBs per TTI	
Rar	RandomAccessResponse Type	RAR to be sent to the UE	
BackoffInd	RandomAccessBackoffIndic ator_Type	possible backoff indicator; 'None' for normal cases	

RandomAccessResponseConfig_Type

TTCN-3 Union Type		
Name	RandomAccessResponseConfig_Type	
Comment		
Ctrl	RandomAccessResponseCtrl Ty	contains information to control sending of RAR
	<u>pe</u>	
Ctrl_CRC_Erro	RandomAccessResponseCtrl Ty	same as Ctrl (see above), but MAC PDU transmitted will contain
r	<u>pe</u>	CRC bits (0-3) being toggled;
		no retransmissions shall be made as UE shall not send a NACK
None	Null Type	to be used when there is no RAR to be sent at all

RachProcedure_Type

TTCN-3 Record Type		
Name	RachProcedure_Type	
Comment		
RAResponse	RandomAccessResponseC onfig_Type	control of how the SS shall react on RA preamble; this may be - the RAP id as expected by the UE - a RAP id not matching to the UE's RAP - a backoff indicator - nothing at all
ContentionRes olutionCtrl	ContentionResolutionCtrl T	

RachProcedureList_Type

RachProcedureConfig_Type

D.1.5.3 MAC_Configuration

MAC configuration: radio bearer specific configuration

EUTRA_ASP_TypeDefs: Constant Definitions

TTCN-3 Basic Types			
tsc_MaxHarqRetran smission	integer	28	maximum value for maxHARQ- Msg3Tx as being signalled to the UE

MAC_Test_DLLogChID_Type

TTCN-3 Union	Туре	
Name	MAC_Test_DLLogChID_Type	
Comment		
LogChld	TestLogicalChannelId_Type	Specifies to over write the logical channel ID in MAC header in all the DL messages sent on the configured logical channel
ConfigLchId	Null Type	Specifies that the normal mode of correct logical channel ID to be used in DL MAc header. This will be the default mode, when SS is initially configured.

MAC_Test_DL_SCH_CRC_Mode_Type

TTCN-3 Enumerated 1	Гуре	
Name	MAC_Test_DL_SCH_CRC_Mode_Type	
Comment		
Normal	default mode, the CRC generation is correct	
Erroneous	SS shall generate CRC error by toggling CRC bits; the CRC error shall be applied for all PDUs of the given RNTI and their retransmission until SS is configured back to 'normal' operation	
Error1AndNormal	the SS generates wrong CRC for first transmission and correct CRC on first retransmission. Later SS operates in normal mode. The retransmission is automatically triggered by reception of HARQ NACK	

MAC_Test_SCH_NoHeaderManipulation_Type

TTCN-3 Enumerated T	TTCN-3 Enumerated Type		
Name	MAC_Test_SCH_NoHeaderManipulation_Type		
Comment			
NormalMode	MAC header is fully controlled by the SS		
DL_SCH_Only	TTCN can submit a final MAC PDU including header and payloads; SS does not do anything with this MAC PDU i.e. no header is added for the DL SCH transport channel. It is possible that data belonging to multiple DRBs is sent in one MAC PDU and from one special RB configured. NOTE: SRBs shall work as in normal mode and data can be sent/received on SRBs but sending on SRBs shall be in different TTIs than sending data PDUs.		
DL_UL_SCH	In UL and DL the SS' MAC layer is transparent i.e. SS does not add or remove any MAC header

Comment	CellId: identifier of the cell wh	nere th	e UE is active
	RoutingInfo : None		
	TimingInfo : Calculated pagin	g occa	asion
	ControlInfo : CnfFlag:=false; I	ollow	OnFlag:=false
	primitive to trigger transmission	on of a	paging on the PCCH at a calculated paging occasion (TS 36.304,
	clause 7);		
	the paging occasion is calculated by TTCN and activation time is applied;		
			1, clause 9.1.1.3 "RRC will perform padding, if required due to the
	granularity of the TF signalling, as defined in 8.5.";		
	therefore this needs to be done by the system simulator		
Paging	PCCH_Message		paging to be send out at paging occasion and being announced
			on PDCCH using P-RNTI
SubframeOffset	Paging SubframeOffsetList	opt	list of subframe offsets relative to the absolute timing information
List	_Type		given in the common part of the ASP;
			if present, multiple pagings are sent out at all occasions given by
			the list;
			if omitted only a single paging is sent at the occasion given
			timing information given in the common part of the ASP

D.1.9 L1_MAC_Indication_Control

Primitive for control of L1/MAC indication for special purposes

L1Mac_IndicationMode_Type

TTCN-3 Enumerated Type		
Name	L1Mac_IndicationMode_Type	
Comment		
enable		
disable		

L1Mac_IndicationControl_Type

TTCN-3 Record Type			
Name	L1Mac_IndicationControl_Type		
Comment	NOTE: Initially all indications are disabled in SS (i.e. it shall not be necessary in 'normal' test cases to use this primitive but only if a specific indication is needed); omit means indication mode is not changed		
RachPreamble	L1Mac IndicationMode Ty	opt	To enable/disable reporting of PRACH preamble received.
SchedReq	L1Mac_IndicationMode_Ty pe	opt	To enable/disable reporting of reception of Scheduling Request on PUCCH.
BSR	L1Mac IndicationMode Ty pe	opt	To enable/disable reporting of Buffer Status Report. NOTE: this is applicable only when MAC is configured in normal mode in UL; MAC configured in test mode, results in over writing the report.
UL_HARQ	L1Mac_IndicationMode_Ty pe	opt	To enable/disable reporting of reception of HARQ ACK/NACK.
C_RNTI	L1Mac IndicationMode Ty	opt	To enable/disable reporting of C-RNTI sent by the UE within MAC PDU
PHR	L1Mac_IndicationMode_Ty pe	opt	To enable/disable reporting of Power Headroom Report. NOTE: this is applicable only when MAC is configured in normal mode in UL; MAC configured in test mode, results in over writing the report.
HarqError	L1Mac IndicationMode Ty	opt	To enable/disable reporting of HARQ errors
PeriodicRI	L1Mac_IndicationMode_Ty pe	opt	To enable/disable reporting of reception of periodic Rank Indicators

D.1.10 Rlc_Indication_Control

Primitive for control of RLC indication for special purposes

Rlc_IndicationMode_Type

TTCN-3 Enumerated Type		
Name	RIc_IndicationMode_Type	
Comment		
enable		
disable		

RIc_IndicationControl_Type

TTCN-3 Record Type			
Name	RIc_IndicationControl_Type		
Comment			
Discard	Rlc IndicationMode Type	opt	To enable/disable reporting of discarded RLC PDUs

D.1.11 PDCP_Count

Primitives to enquire PDCP COUNT

PDCP_Count: Basic Type Definitions

TTCN-3 Basic Types		
PdcpCountValue_Type	B32 Type	

PdcpCountFormat_Type

TTCN-3 Enumerated Type		
Name	PdcpCountFormat_Type	
Comment		
PdcpCount_Srb	27 bit HFN; 5 bit SQF	
PdcpCount_DrbLong SQN	20 bit HFN; 12 bit SQF	
PdcpCount_DrbShort SQN	25 bit HFN; 7 bit SQF	

PdcpCount_Type

TTCN-3 Record Type		
Name	PdcpCount_Type	
Comment		
Format	PdcpCountFormat_Type	
Value	PdcpCountValue_Type	

PdcpCountInfo_Type

TTCN-3 Record Type			
Name	PdcpCountInfo_Type		
Comment			
RadioBearerId	RadioBearerId_Type		
UL	PdcpCount_Type	opt	omit: keep as it is
DL	PdcpCount_Type	opt	omit: keep as it is

PdcpCountInfoList_Type

TTCN-3 Record of Type		
Name	PdcpCountInfoList_Type	
Comment		
record length (1tsc_MaxRB) of PdcpCountInfo_Type		

PdcpCountGetReq_Type

TTCN-3 Union Type			
Name	PdcpCountGetReq_Type		
Comment			
AllRBs	Null Type	return COUNT values for all RBs being configured	
SingleRB	RadioBearerId Type		

PDCP_CountReq_Type

TTCN-3 Union	TTCN-3 Union Type			
Name	PDCP_CountReq_Type			
Comment				
Get	PdcpCountGetReq Type	Request PDCP count for one or all RBs being configured at the PDCP		
Set	PdcpCountInfoList_Type	Set PDCP count for one or all RBs being configured at the PDCP; list for RBs which's COUNT shall be manipulated		

PDCP_CountCnf_Type

TTCN-3 Union Type			
Name	PDCP_CountCnf_Type		
Comment			
Get	PdcpCountInfoList Type	RBs in ascending order; SRBs first	
Set	Null Type		

D.1.12 PDCP_Handover

Primitives to control PDCP regarding handover

PDCP_HandoverInit_Type

TTCN-3 Record Type		
Name	PDCP_HandoverInit_Type	
Comment		
SourceCellId	EUTRA_Cellid_Type	

PDCP_HandoverControlReq_Type

TTCN-3 Union T	TTCN-3 Union Type		
Name	PDCP_HandoverControlReq_Type		
Comment			
HandoverInit	PDCP HandoverInit Type	to inform SS that a handover will follow: in the common ASP part the CellId shall be set to the id of the target cell	
HandoverComp lete	Null Type	to inform SS that the handover has successfully been performed by the UE; this shall trigger the SS to sent a PDCP Status Report to the UE; in the common ASP part the CellId shall be set to the id of the target cell	

D.1.13 L1_MAC_Test_Mode

Primitive for control of L1/MAC Test Modes

L1_TestMode_Type

TTCN-3 Record Type			
Name	L1_TestMode_Type		
Comment	L1 test mode; in general RACH is handled separately		
DL_SCH_CRC	DL SCH CRC Type Manipulation of CRC bit generation for DL-SCH		
Phich	PhichTestMode Type		HARQ feedback mode on the PHICH

DL_SCH_CRC_Type

TTCN-3 Union 1	TTCN-3 Union Type		
Name	DL_SCH_CRC_Type		
Comment	NOTE:		
	CRC error mode for RA_RNTI is no	t addressed as it will be configured in RACHProcedureConfig	
C_RNTI	MAC Test DL SCH CRC Mode to configure mode for CRC bit for all MAC PDU's for which C-		
	<u>Type</u>	RNTI is used in PDCCH transmission	
SI_RNTI	MAC_Test_DL_SCH_CRC_Mode	to configure mode for CRC bit for all MAC PDU's for which SI-	
	_Type	RNTI is used in PDCCH transmission	
SPS_RNTI	MAC Test DL SCH CRC Mode	to configure mode for CRC bit for all MAC PDU's for which SPS-	
	_Type	RNTI is used in PDCCH transmission	

D.1.14 PDCCH_Order

Primitive to trigger SS to send PDCCH order to initiate RA procedure (TS 36.321, clause 5.1.1)

PDCCH_Order: Basic Type Definitions

TTCN-3 Basic Types		
PrachPreambleIndex_Typ	Ra_PreambleIndex_Type	
е		
PrachMaskIndex_Type	integer (015)	TS 36.321, clause 7.3

RA_PDCCH_Order_Type

TTCN-3 Record Type				
Name	RA_PDCCH_Order_Type			
Comment	see also TS 36.212, clause 5.3.3.1.3			
PreambleIndex	PrachPreambleIndex Type	PrachPreambleIndex Type naming acc. TS 36.212, clause 5.3.3.1.3		
PrachMaskInde	PrachMaskIndex Type	naming acc. TS	36.212, clause 5.3.3.1.3	
Х				

D.1.15 System_Indications

Primitives for System indications

System_Indications: Basic Type Definitions

TTCN-3 Basic Types	TTCN-3 Basic Types		
PRTPower_Type	Dummy Type	needs to define appropriately the power level report of PREAMBLE_RECEIVED_TARGET_POWER; NOTE: for the time being this is just a place holder for enhancements in the future.	
LogicalChannelGroup_Ty	integer (03)		
pe			
BSR_Value_Type	integer (063)		
PHR_Type	integer (063)		
RI_Type	integer (14)	Rank indicator reported acc. to TS 36.212 Table 5.2.2.6-6	

HarqProcessInfo_Type

TTCN-3 Record	TTCN-3 Record Type			
Name	HarqProcessInfo_Type			
Comment				
ld	HargProcessId Type			
CURRENT_TX _NB	integer	acc. to TS 36.321 clause 5.4.2.2		

HarqError_Type

TTCN-3 Union Type		
Name	HarqError_Type	
Comment		
UL	HarqProcessInfo_Type	indicates HARQ error detected at the SS side (error at UL transmission)
DL	HarqProcessInfo_Type	indicates HARQ NACK sent by the UE (error at DL transmission)

RachPreamble_Type

TTCN-3 Record Type		
Name	RachPreamble_Type	
Comment		
RAPID	PrachPreambleIndex Type	indicates the RAPID of the preamble used (integer (063))
PRTPower	PRTPower_Type	represents the PREAMBLE_RECEIVED_TARGET_POWER

Short_BSR_Type

TTCN-3 Record Type			
Name	Short_BSR_Type		
Comment			
LCG	LogicalChannelGroup Type		Logical channel Group
Value	BSR Value Type		BSR value

Long_BSR_Type

TTCN-3 Record Type			
Name	Long_BSR_Type		
Comment			
Value_LCG1	BSR Value Type	BSR value for LCG 1	
Value_LCG2	BSR Value Type	BSR value for LCG 2	
Value_LCG3	BSR Value Type	BSR value for LCG 3	
Value LCG4	BSR Value Type	BSR value for LCG 4	

BSR_Type

TTCN-3 Union Type		
Name	BSR_Type	
Comment		
Short	Short BSR Type	
Truncated	Short BSR Type	
Long	Long BSR Type	

HARQ_Type

TTCN-3 Enumerated Type				
Name	HARQ_Type			
Comment	ack represents HARQ ACK; nack represents HARQ_NACK			
ack				
nack				

RlcDiscardInd_Type

TTCN-3 Record Type			
Name	RlcDiscardInd_Type		
Comment	SS shall send this indication if it discards a received RLC AMD PDU as specified in TS 36.322 cl. 5.1.3.2.2.		
SequenceNum ber	integer		sequence number of the PDU being discarded

D.1.16 System_Interface

${\bf SYSTEM_CTRL_REQ}$

TTCN-3 Reco	rd Type	
Name	SYSTEM_CTRL_REQ	
Comment		
Common	ReqAspCommonPart Type	TimingInfo depends on respective primitive:
Request	SystemRequest Type	- Cell TimingInfo: 'now' (in general) - CellAttenuationList TimingInfo: 'now' (in general, but activation time may be used also) - RadioBearerList TimingInfo: 'now' in general; activation time may be used in special case for release and/or reconfiguration of one or several RBs; the following rules shall be considered: - release/Reconfiguration of an RB shall not be scheduled ealier than 5ms after a previous data transmission on this RB - subsequent release and reconfiguration(s) shall be scheduled with an interval of at least 5ms - a subsequent data transmission on an RB shall not be scheduled ealier than 5ms after the last reconfiguration of the RB the configuration shall be performed exactly at the given time - EnquireTiming TimingInfo: 'now' - AS_Security TimingInfo: 'now'; NOTE: "activation time" may be specified in the primitive based on PDCP SQN - Sps TimingInfo: calculated paging occassion - L1MacIndCtrl TimingInfo: Calculated paging occassion - L1MacIndCtrl TimingInfo: 'now' (in general) - PdcpCount TimingInfo: 'now' - L1_TestMode TimingInfo: depends on the test mode; activation time is used e.g. for manipulation of the CRC - PdcchOrder TimingInfo: 'now' (in general)

${\bf SYSTEM_CTRL_CNF}$

TTCN-3 Record Type			
Name	SYSTEM_CTRL_CNF		
Comment			
Common	CnfAspCommonPart_Type		TimingInfo is ignored by TTCN (apart from EnquireTiming) => SS may set TimingInfo to "None"
Confirm	SystemConfirm_Type		

${\bf SYSTEM_IND}$

TTCN-3 Record Type			
Name	SYSTEM_IND		
Comment			
Common	IndAspCommonPart Type	The SS shall provide TimingInfo (SFN + subframe number) depending on the respective indication:	
Indication	SystemIndication_Type	- Error/HarqError TimingInfo: related to the error (if available) - RachPreamble TimingInfo: shall indicate start of the RACH preamble - SchedReq TimingInfo: subframe containing the SR - BSR TimingInfo: subframe in which the MAC PDU contains the BSR - UL_HARQ TimingInfo: subframe containing the UL HARQ - C_RNTI TimingInfo: subframe in which the MAC PDU contains the C_RNTI - PHR TimingInfo: subframe in which the MAC PDU contains the PHR	

EUTRA_SYSTEM_PORT

TTCN-3 Port Type		
Name	EUTRA_SYSTEM_PORT	
Comment	EUTRA PTC: Port for system configuration	
out	SYSTEM CTRL REQ	
in	SYSTEM CTRL CNF	

EUTRA_SYSIND_PORT

TTCN-3 Port Type		
Name	EUTRA_SYSIND_PORT	
Comment	EUTRA PTC: Port for system indications	
in	SYSTEM_IND	

D.2 EUTRA_ASP_DrbDefs

ASP interface for DRBs

D.2.1 PDU_TypeDefs

D.2.1.1 MAC_PDU

MAC_PDU: Basic Type Definitions

TTCN-3 Basic Types		
MAC_CTRL_C_RNTI_Typ	C_RNTI	TS 36.321, clause 6.1.3.2
е		
MAC_CTRL_ContentionR	ContentionResolutionId Type	TS 36.321, clause 6.1.3.4
esolutionId_Type		fix 48-bit size;
		consists of a single field defined UE
		Contention Resolution Identity
		(uplink CCCH SDU transmitted by MAC)
MAC_CTRL_TimingAdvan	B8 Type	TS 36.321, clause 6.1.3.5
ce_Type		indicates the amount of timing adjustment in
		0.5 ms that the UE has to apply;
		the length of the field is [8] bits
MAC_SDU_Type	octetstring	

MAC_PDU_Length_Type

TTCN-3 Record	Туре	
Name	MAC_PDU_Length_Type	
Comment	NOTE: since F and L field are either both present or both omitted they are put into this record; to allow homogeneous (direct) encoding the PDU length is not defined as union; TTCN-3 does allow length restrictions to one length or a range of length but not to two specific lengthes; further restriction may be achieved by appropriate templates (parameter either 7 or 15 bit)	
Format	B1 Type	F: The Format field indicates the size of the Length field as indicated in table 6.2.1-3. There is one F field per MAC PDU subheader except for the last subheader and sub-headers corresponding to fixed-sized MAC control elements. The size of the F field is 1 bit. If the size of the MAC SDU or MAC control element is less than 128 bytes, the UE shall set the value of the F field to 0, otherwise the UE shall set it to 1
Value	B7 15 Type	L: The Length field indicates the length of the corresponding MAC SDU or MAC control element in bytes. There is one L field per MAC PDU subheader except for the last subheader and sub-headers corresponding to fixed-sized MAC control elements. The size of the L field is indicated by the F field

MAC_PDU_SubHeader_Type

TTCN-3 Record Type			
Name	MAC_PDU_SubHeader_Typ	е	
Comment			
Reserved	B2 Type		Reserved bits
Extension	B1 Type		E: The Extension field is a flag indicating if more fields are present in the MAC header or not. The E field is set to "1" to indicate another set of at least R/R/E/LCID fields. The E field is set to "0" to indicate that either a MAC SDU, a MAC control element or padding starts at the next byte
LCID	B5_Type		LCID: The Logical Channel ID field identifies the logical channel instance of the corresponding MAC SDU or the type of the corresponding MAC control element or padding as described in tables 6.2.1-1 and 6.2.1-2 for the DL and UL-SCH respectively. There is one LCID field for each MAC SDU, MAC control element or padding included in the MAC PDU. The LCID field size is 5 bits; NOTE: In case of DRX command the sub-header corresponds to a control element of length zero (i.e. there is no control element)
Length	MAC PDU Length Type	opt

Comment	NASEMU PTC: Port for Sending/Receiving data on SRBs (interface to EUTRA PTC)	
Out	SRB COMMON IND	
In	SRB COMMON REQ	

D.4 IP_ASP_TypeDefs

General Notes:

NOTE 1:

In general the handling of IP data shall be independent from the RAT being used on lower layers.

NOTE 2:

It shall be possible for SS implementation to reuse existing IP stack implementations in the system adaptor;

therefore the well-known concept of socket programming shall be supported

(regardless of whether those are used in the system adaptor implementation or not)

NOTE 3:

Since in general at the network side there are several different IP addresses the SS needs to simulate more than one IP address;

that can be based on a concept of multiple virtual network adaptors

NOTE 4:

There is no easy way to control the routing of IP data for an IP connection from above the IP stack

i.e. there are no parameters at the socket interface to determine e.g. cell id and DRB id

=> another independent logical entity (DRB-MUX) is needed below the IP stack which is responsible to control the routing of IP packets from/to DRBs in different cells of different RATs

Reference:

An introduction to socket programming can be found in UNIX Network Programming Volume 1, Third Edition: The Sockets Networking API by W. Richard Stevens, Bill Fenner, Andrew M. Rudoff

D.4.1 IP Common

IP Common: Basic Type Definitions

TTCN-3 Basic Types		
PortNumber_Type	<u>UInt16_Type</u>	

IPv4_AddrInfo_Type

TTCN-3 Record Type			
Name	IPv4_AddrInfo_Type		
Comment	IPv4 specific info of the socket addr (AF_INET)		
Addr			IP Address as string (IP v4 dot notation) to be converted to 32-bit unsigned integer

IPv6 AddrInfo Type

TTCN-3 Record	TTCN-3 Record Type		
Name	IPv6_AddrInfo_Type		
Comment	IPv6 specific info of the socket addr (AF_INET6); NOTE: sin6_flowinfo can be ignored and set to 0		
Addr	charstring to be converted to sin6_addr		
Scopeld	Ulnt32 Type	opt	sin6_scope_id in general an IPv6 address is like "fe80::1%eth0" with eth0 being the network adaptor mapped to a scope id (Unix) assumption: for UE conformance testing it is not necessary to distiguish different scopes and the scope id in general can be determined by the system adaptor => omit

Protocol	InternetProtocol_Type		
Local	IP Socket Type	opt	
Remote	IP_Socket_Type	opt	

D.4.2 IP_Config

Configuration of the routing table managed be the system adaptor's DRB-MUX:

foreach IP connection it is specified which

- RAT
- Cell
- DRB

to be used.

The IP connection does not need to be fully specified depending on the role SS plays (e.g. in case of a server role the port number of the remote side is not known in advance).

The configurations of DRBs within the same cell shall be mutual exclusive.

With the configuration of the IP routing the DRB is configured either in IP or in raw mode: either there are entries for the DRB in the routing table (IP mode) or not (raw mode)

=> It is not necessary to reconfigure this for the respective RAT.

Behaviour of the DRB-MUX in UL:

- SS gets data packet from the lower layers (e.g. PDCP SDU)
- SS checks whether there is any IP connection configured for this DRB (identified by {RAT, CellId, DrbId}) if YES => packet is routed to the IP stack (IP mode)

if NO => packet is handed over to the DRB port (raw mode)

NOTE 1:

If there is any entry for a DRB in the routing table this DRB is considered as being in IP mode and all UL IP packets are sent to the IP stack regardless of whether their addresses match the DRB's routing entries or not (in general 'unknown' packets are discarded by the IP stack)

=> a DRB can be either in IP or in raw mode

NOTE 2:

=> The SS does not need to evaluate any IP headers to decide whether data shall be routed to the DRB port or to the IP stack (i.e. there is no conflict with unstructured loopback data)

Behaviour of the DRB-MUX in DL:

- SS gets IP packets from the IP stack for an IP connection
- SS compares the IP connection (protocol, local/remote IP Addr) against the IP routing table and checks whether the corresponding protocol stack is configured at the lower layers =>
 - 1. no match:

no entry in the routing table fits to the address in the IP packet or the corresponding RB is not configured

=> SS shall raise an error (DRBMUX_COMMON_IND_CNF.Error)

2. one match:

There is exactly one possibility to route the IP packet

=> SS shall send the packet to this RB

3. several matches:

There are more than one DRBs, cells or RATs to which the packet may be routed

=> SS shall raise an error if there is more than one DRB in one cell matching; if the DRBs belong to different cells or RATS SS shall send the data to all of them (whether this may occur in test cases is FFS)

General notes:

NOTE 1:

SS may use the information of the routing table to determine which network adaptors it needs to simulate (implementation dependent);

in general there will be more than one IP address at the network side.

NOTE 2:

In general the routing table is a simplified DL TFT implementation

NOTE 3:

When the routing table is empty all DRBs are in raw mode; this shall be the initial condition at the DRB-MUX; => for L2 testing in general (and apart from the preamble) there is no need to use/configure the IP_PTC; the configuration of the RAT specific U-plane stacks is not affected

IP_Config: Basic Type Definitions

TTCN-3 Basic Types			
IP_DrbId_Type	integer	DRB identity type common for all RATs: - for EUTRA it corrensponds to the ASN.1 type DRB-Identity - for UTRAN/GERAN it corrensponds the NSAPI value (type record NSAPI) NOTE: this is introduced to simplify the dependencies (i.e. to keep IP_ASP_TypeDefs independent from any RAT specific type definitions)

SA_List	IPsec SecurityAssociationL ist Type		

D.4.4 IP_SocketHandling

Handling of IP data and IP connections

NOTE 1:

In general IP connections are distinguished by the tuple $\{protocol, local socket, remote socket\};$

this information is used at the interface between TTCN and the system adaptor.

It is up the system adaptor implementation to associate the IP connection with the internal socket (file descriptor; implementation dependent)

NOTE 2:

In general the association of the IP connections to (internal) sockets and the routing table for the DRB mapping (as configured with IP_RoutingTable_Type) are independent from each other

D.4.4.1 Socket_Common

IP_SockOpt_Type

TTCN-3 Union Type			
Name	IP_SockOpt_Type		
Comment	socket API); NOTE: only options being relevant for a spe	ecific applications (upon a socket) are configured by TTCN and therefore a matter of system adaptor	
SO_BROADCA ST	boolean	set to true when IP broadcast messages shall be allowed for a port; this is required e.g. in case of DHCP	

IP_SockOptList_Type

TTCN-3 Record of Type			
Name	IP_SockOptList_Type		
Comment			
record of IP SockOpt Type			

IP_SocketError_Type

TTCN-3 Union T	TTCN-3 Union Type		
Name	IP_SocketError_Type		
Comment	used to indicate errors related to sockets;		
	the IP_Connection shall contain as much address information as available at the system adaptor		
InvalidAddress	Null_Type	TTCN error: e.g. invalid or incomplete address information	
System	integer	system error caused by system call;	
		the integer value may be used for validation but shall not be	
		evaluated by TTCN	

D.4.4.2 Socket_Datagram

Socket_Datagram: Basic Type Definitions

TTCN-3 Basic Types		
Datagram_Content_Type	octetstring	data as sent/received with sendto()/recvfrom() on UDP or ICMP socket; NOTE: For ICMP the data may depend on the socket options (FFS); in general it does not include the IP header and the checksum of the ICMP packet needs to be calculated/checked in TTCN

Datagram_DL_Type

TTCN-3 Record Type				
Name	Datagram_DL_Type			
Comment	datagram to be sent at a UDP or ICMP socket			
Buffer	Datagram Content Type		content of the IP packet	

Datagram_UL_Type

TTCN-3 Record Type			
Name	Datagram_UL_Type		
Comment	datagram as received on a L	JDP or	ICMP socket
Buffer	Datagram Content Type		content of the IP packet
DrbInfo	IP DrbInfo Type	opt	"interface id" where the data comes from in case of broadcast or multicast packets: for the LTE test model this is the DRB on which the IP packet has been received; the information is necessary when the SS cannot resolve an IP address being assigned to that DRB. => when the SS provides a broadcast or multicast address as local address in the ConnectionId of the ASP, the SS shall provide the DRB information in this field When the ConnectionId of the ASP is fully specified and unique (unicast address at least for local address) the DrbId is ignored by TTCN

D.4.4.3 TCP_Socket

TCP primitives used on the IP port

TCP_Socket: Basic Type Definitions

TTCN-3 Basic Types		
TCP_Data_Type	octetstring	data as sent/received with send()/recv() on a
	-	TCP socket

InternetApplication_Type

TTCN-3 Enumerated 1	TTCN-3 Enumerated Type		
Name	InternetApplication_Type		
Comment	as TCP is stream oriented SS may need information about which criteria to be applied to get start/end of an application message		
ims			
http			

TCP_ConnectRequest_Type

TTCN-3 Record Type			
Name	TCP_ConnectRequest_Type		
Comment	TCP client: -> 'connect' system call		
SockOptList	IP SockOptList Type		when there are no options to configure the list is empty
Application	InternetApplication Type		to specify start/end criteria for application messages

TCP_Listen_Type

TTCN-3 Record Type			
Name	TCP_Listen_Type		
Comment	TCP server: -> 'listen' system	call	
SockOptList	IP SockOptList Type		when there are no options to configure the list is empty
Application	InternetApplication Type		to specify start/end criteria for application messages

TCP_CtrlRequest_Type

TTCN-3 Union	Туре	
Name	TCP_CtrlRequest_Type	
Comment		
ConnectReq	TCP ConnectRequest Type	request a 'connect' to a remote server
		system calls (informative) socket get file descriptor (setsockopt) normally not needed bind assign local IP addr (to cope with multiple IP
		addresses) and dedicated port number (if local port is given) connect connect to the client
		IP_Connection: protocol tcp local IP addr mandatory to distinguish different network adaptors local port omit (ephemeral port will be assigned by the system) or specific port to be used for this connection (e.g. to
		bind a given port number to the IMS client) remote IP addr mandatory remote port mandatory
Listen	TCP Listen Type	establish a server at the local (SS) side
		system calls (informative) socket get file descriptor (setsockopt) if needed bind assign local IP addr and port listen await incoming connection
		IP_Connection: protocol tcp local IP addr mandatory to distinguish different network adaptors local port mandatory remote IP add omit remote port omit
Close	Null Type	close a connection
		system calls (informative): close
		IP_Connection: protocol tcp local IP addr mandatory local port mandatory remote IP addr mandator for TCP connections, omit for TCP server y remote port mandator for TCP connections, omit for TCP
		server y

TCP_DataRequest_Type

TTCN-3 Union 7	Гуре	
Name	TCP_DataRequest_Type	
Comment		
Send	TCP Data Type	send data
		system calls (informative): send or write
		IP_Connection: protocol tcp local IP addr mandatory local port mandatory remote IP addr mandatory remote port mandatory

TCP_CtrlIndication_Type

TTCN-3 Union	Туре	
Name	TCP_CtrlIndication_1	Гуре
Comment		
ConnectCnf	Null Type	confirm a 'connect' to a remote server
		system calls (informative): getsockname get local port (ephemeral port assigned by the system)
		IP_Connection: protocol tcp local IP addr mandatory (as in corresponding TCP_ConnectRequest) local port mandatory (if there is more than one connection to the same server the local port is necessary to distinguish the connections) remote IP addr mandatory (as in corresponding TCP_ConnectRequest) remote port mandatory (as in corresponding TCP_ConnectRequest)
Accept	Null Type	sent by the SS when it 'accepts' an incoming connection
Лосорі	ivum Typo	system calls (informative): accept
		IP_Connection: protocol tcp local IP addr mandatory (as in corresponding TCP_ListenRequest) local port mandatory (as in corresponding TCP_ListenRequest) remote IP addr mandatory (as gotten from 'accept') remote port mandatory (as gotten from 'accept')
Close	Null Type	indicate 'close' by the remote side system calls (informative): indicated by recv or read
		IP_Connection: protocol tcp local IP addr mandatory local port mandatory remote IP addr mandatory remote port mandatory
CloseCnf	Null Type	Confirmation for 'close' request; necessary since for TCP there are IP packets to release the connection
		system calls (informative): close IP_Connection: protocol tcp local IP addr mandatory local port mandatory remote IP addr mandatory
		remote port mandatory

TCP_DataIndication_Type

TTCN-3 Union	TTCN-3 Union Type		
Name	TCP_DataIndication_Typ	e	
Comment			
Recv	TCP Data Type	receive data	
		system calls (informative): recv or read	
		IP_Connection: protocol tcp local IP addr mandatory local port mandatory remote IP addr mandatory remote port mandatory	

D.4.4.4 UDP_Socket

UDP primitives used on the IP port

NOTE

In principle a UDP socket may communicate with different remote entities; therefore the system adaptor may associate the socket handle with the local socket only (local IP address and local port)

UDP_SocketReq_Type

TTCN-3 Record Type		
Name	UDP_SocketReq_Type	
Comment	to establish a UDP server or to bind local port number	
SockOptList	IP_SockOptList_Type	e.g. to allow broadcast messages; when there are no options to configure the list is empty

UDP_CtrlRequest_Type

TTCN-3 Unior	n Туре	
Name	UDP_CtrlRequest_Type	
Comment		
SocketReq	UDP SocketReq Type	request the system adaptor to bind a socket to a local address; this is needed in general when the system adaptor acts as 1. UDP server 2. UDP client when it uses a well-known port rather than an ephemeral port (this is e.g. for DHCP) 3. UDP client when a local address needs to be bond (e.g. when there are several local addresses) system calls (informative):
		socket get file descriptor (setsockopt) needed e.g. to allow broad cast message bind assign local IP address (to cope with multiple IP addresses) and local port (in case of well-known local port)
		IP_Connection: protocol udp local IP addr mandatory (to distinguish multiple IP addresses) local port optional (mandatory in case of a UDP server) remote IP addr omit remote port omit
Close	Null Type	release local socket system calls (informative): close
		IP_Connection: protocol udp local IP addr mandatory (to identify local socket) local port mandatory (to identify local socket) remote IP addr omit remote port omit

UDP_DataRequest_Type

TTCN-3 Union	Гуре	
Name	UDP_DataRequest_Type	
Comment		
SendTo	Datagram DL Type	send data to (any) remote socket; NOTE: To simplify implementation of the system adaptor the local socket shall be bond in any case (using 'SocketReq') to specify the local IP address before sending data; (in general the sendto system call can be used without explicitly binding the socket before; in this case the port gets implicitly bond to an ephemeral port and the default IP address is used) system calls (informative): sendto IP_Connection: protocol udp local IP addr mandatory (to identify local socket) local port mandatory (to address remote socket) remote IP addr mandatory (to address remote socket)

UDP_CtrlIndication_Type

TTCN-3 Union	n Type	
Name	UDP_CtrlIndication_Type	
Comment		
SocketCnf	Null Type	confirm 'SocketReq' and tell TTCN about assignment of ephemeral port; system calls (informative): getsockname get local port (ephemeral port assigned by the system; not needed if local port is well-known) IP_Connection: protocol udp local IP addr mandatory local port mandatory (well-known or ephemeral port assigned by the system) remote IP addr omit remote port omit

UDP_DataIndication_Type

TTCN-3 Union	n Type	
Name	UDP_DataIndication_Type	
Comment		
RecvFrom	Datagram UL Type	receive data;
		system calls (informative):
		recvfrom get data and src addr
		IP Connection:
		protocol udp
		local IP addr mandatory (see note)
		local port mandatory
		remote IP addr mandatory (as gotten from recvfrom)
		remote port mandatory (as gotten from recvfrom)
		NOTE
		NOTE:
		The UE may send a UDP packet as broadcast (IP Addr
		255.255.255.255 - e.g. in case of DHCP) or multicast (e.g.
		ICMPv6)
		SS shall consider a broadcast address as matching every IP for UL and DL:
		the SS shall not replace the broadcast/multicast address by the
		local unicast address, but shall provide DRB information in
		RecvFrom;
		example:
		- SS gets DHCPDISCOVER with
		DEST_Addr=255.255.255.255 DEST_Port=67,
		SRC_Addr=0.0.0.0 SRC_Port=68
		- TTCN gets DHCPDISCOVER with local
		Addr=(255.255.255.255 Port=67), remote Addr=(0.0.0.0
		Port=68), DrbId=(LTE, cell1, DRB1)
		- TTCN sends DHCPOFFER with local Addr=(local IP Addr
		Port=67), remote Addr=(255.255.255.255 Port=68)

D.4.4.5 ICMP_Socket

ICMP primitives used on the IP port NOTE:

the local side is identified by the protocol and in general by the local IP address

ICMP_SocketReq_Type

TTCN-3 Record Type		
Name	ICMP_SocketReq_Type	
Comment	to establish a raw socket to send/re	eceive ICMP packets
SockOptList	IP SockOptList Type	e.g. to set the IP_HDRINCL socket option (to include the IP header in the data buffer) -> FFS when there are no options to configure the list is empty

ICMP_CtrlRequest_Type

TTCN-3 Unior	n Type	
Name	ICMP_CtrlRequest_Type	
Comment		
SocketReq	ICMP_SocketReq_Type	request the system adaptor to open a raw socket (IPv4 or IPv6) system calls (informative): socket get file descriptor (IPPROTO_ICMP or IPPROTO_IPv6); (setsockopt) optional; to set socket options bind assign local IP address (to cope with multiple IP addresses)
		IP_Connection: protocol icmp or icmpv6 local IP addr mandatory (to distinguish multiple IP addresses) local port omit (not applicable for ICMP) remote IP addr omit remote port omit (not applicable for ICMP)
Close	Null Type	release local socket system calls (informative): close IP_Connection: protocol icmp or icmpv6 local IP addr mandatory (to identify local socket) local port omit remote IP addr omit

ReqAspControlInfo_Type

TTCN-3 Record	TTCN-3 Record Type		
Name	ReqAspControlInfo_Type		
Comment			
CnfFlag	boolean	true => SS shall send CNF: when the REQ is with no timing information (no activation time), SS shall send the confirmation when the configuration is done, i.e. when the test case may continue. Example: when there is a configuration follow by a send event it shall not be necessary to have a wait timer in between but the CNF triggers the send event. If there are other triggers e.g. like the UE sending a message, CnfFlag shall be set to false by the test case to avoid racing conditions with the CNF and the signalling message. When there is an activation time SS shall send the CNF after the configuration has been scheduled; that means SS shall not wait until the activation time has been expired.	
FollowOnFlag	boolean	false => no further (related) information true: further related information will be sent to SS (semantics depending on respective ASP)

D.7.1.4 CDMA2000_ReqAspCommonPart

CDMA2000_ReqAspControlInfo_Type

TTCN-3 Record	d Type	
Name	CDMA2000_ReqAspCo	ntrollnfo_Type
Comment		
CnfFlag	boolean	true => SS shall send CNF: when the REQ is with no timing information (no activation time), SS shall send the confirmation when the configuration is done, i.e. when the test case may continue. Example: when there is a configuration follow by a send event it shall not be necessary to have a wait timer in between but the CNF triggers the send event or system Command. If there are other triggers e.g. like the UE sending a message, CnfFlag shall be set to false by the test case to avoid racing conditions with the CNF and the signalling message. When there is an activation time SS shall send the CNF after the configuration has been scheduled; that means SS shall not wait until the activation time has been expired.
FollowOnFlag	boolean	false => no further (related) information true: further related information will be sent to SS; Currently this value is not foreseen to be used.

HRPD_SystemCommand_Type

TTCN-3 Union T		
Name	HRPD_SystemCommand_Type	
Comment	Null Tupo	CC is synapted to report any possible. Access makes received as
ReportInitialAcc esProbe	Null Type	SS is expected to report any possible Access probes received on HRPD Cell; will be used in situations where UE is not expected to camp on a HRPD Cell
RegAndDefBea rerEst	RegAndDefBearerEst Type	To complete registration and establish Default bearer; Initial UE State is Idle_Null State Indications up to VSNCP protocol and possible IP signalling over DHCPv4 and/or ICMPv6 is performed At the end of procedure, UE is still in Active/Connected state (not pre-registration); SS is expected to send InitialAccessProbeRcvd(only if initial state is not Active and not pre-registration) and RegAndDefBearerEstInd as an indication for successful completion of procedure
DedicatedBear erEst	DedicatedBearerEstRel_Type	Dedicated bearers are established/Activated by VSNP/EMPA protocol; PDN ID and RLP flow ID pairs are provided for each Dedicated bearer At the end of procedure, UE is still in Active/Connected state SS is expected to send InitialAccessProbeRcvd(only if initial state is not Active) and DedicatedBearerEstInd as an indication for successful completion of procedure
MoveToDorma ntState	Null Type	UE is Active_Connected state and is moved to Dormant state SS is expected to send MovedToDormantMode
MoveToActiveS tate	RLP FlowIdList Type	UE is initially Dormant state; UE is made to Move to Active_Connected State List of RLP flow Id's (associated with default + dedicated bearer), need to be established are provided SS is expected to send InitialAccessProbeRcvd
DedicatedBear erRel	DedicatedBearerEstRel Type	Dedicated bearers are released/De-Activated by VSNP terminate and SCP release protocol; At the end of procedure, UE is still in Active/Connected state (not pre-registration) SS is expected to send InitialAccessProbeRcvd(only if initial state is not Active and not pre-registration) and DedicatedBearerRelInd as an indication for successful completion of procedure
DefaultBearerR elDetach	DefaultBearerRelDetach_Type	Default bearer is released by VSNCP terminate and SCP release protocol UE is made to detach by LCP protocol and Possible Channels are released At the end of procedure, UE is in Idle_Null state Notes: When Detach is network initiated the sequence is 1. Default bearer (and hence all associated Dedicated bearers) released by VSNCP terminate 2. UE is detached by LCP terminate procedure When Detach is UE initiated, UE may only perform LCP terminate procedure SS is expected to send InitialAccessProbeRcvd(only if initial state is not Active) and DefaultBearerRelDetachInd as an indication for successful completion of procedure
MobilityFromE UTRA	Null Type	Prepare CDMA SS for receiving tunnelled HRPD Connection Request and Route Update tunnelled in ULHandoverPreparationTransfer Respond with GCSNA encapsulated HRPD Silence Parameters and HRPD Open Loop Parameters, HRPD Traffic Channel Assignment to be sent tunnelled in MobilityFromEUTRACommand Receive Traffic Channel Complete in the HRPD Cell; After Receiving Traffic Channel Assignment, HRPD Silence Parameters and HRPD Open Loop Parameters embedded in EUTRA message MobilityFromEUTRACommand, UE has

		Tuned to HRPD Radio and transmitted Traffic Channel Complete in the HRPD Cell SS is expected to send MobilityFromEUTRACmpl as an indication for successful completion of procedure
AdditionalDefB earerEst	AdditionalDefBearerEst_Type	To establish an additional PDN connection Initial UE State is Idle_Null State or procedure performed through pre-registration Indications up to VSNCP protocol and possible IP signalling over DHCPv4 and/or ICMPv6 is performed At the end of procedure, UE is still in Active/Connected state(not pre-registration); SS is expected to send InitialAccessProbeRcvd (only if initial state is not Active and not pre-registration) and AdditionalDefBearerEstInd as an indication for successful completion of procedure
HRPDZoneReg ister	RegAndDefBearerEst_Type	To update registration by a UE already registered and established Default bearer; Initial UE State is Idle_Null State Indications up to VSNCP protocol and possible IP signalling over DHCPv4 and/or ICMPv6 is performed At the end of procedure, UE is still in Active/Connected state (not pre-registration); SS is expected to send InitialAccessProbeRcvd(only if initial state is not Active and not pre-registration) and RegAndDefBearerEstInd as an indication for successful completion of procedure

D.7.6 CDMA2000_RTT1X

D.7.6.1 RTT1X_Indications

RTT1X call flows in RTT1x cell

Expected Sequence for Attach (Power Up Attach)

- 1. Initial AccessProbeRcvd
- 2. CS_RegistrationStart(Powerup)
- 3. CS_RegistrationCmpl

Expected Sequence for Detach (Power Down Attach)

- 1. Initial AccessProbeRcvd
- 2. CS_RegistrationStart (PowerDown)
- 3. CS_RegistrationCmpl

Expected Sequence for CSFB Call Establishment

- 1. Initial AccessProbeRcvd
- 2. CS_CallEstStart (Origination/ PageResponse)
- 3. ChAssignCmpl (Extended Channel Assignment is sent)
- 4. CS_CallEstCompleted (Acknowledgement Order Sent, Service Connect sent, Service Connect Completion received, Alert Sent/Received and ConnectOrder is received)

Expected Sequence for SRVCC call handover

1. HandoffCmpl

Name	RTT1X_SystemCommand_Type	
Comment		
ReportInitialAcc esProbe	Null Type	SS is expected to report any possible Access probes received on 1XRTT Cell; will be used in situations where UE is not expected to camp on a 1XRTT Cell
CS_Registration	CS Registration Type	Power up attach/ power down attach in 1xRTT cell or Pre registration (Power up attach) tunnelled through a different RAT in case of pre-registration attach, the CDMA SS starts by sending mobilityParameters to be tunnelled in CSFBParametersRequestCDMA2000 SS is expected to send InitialAccessProbeRcvd (only if initial state is not pre-registration) and CS_RegistrationCmpl as an indication for successful completion of procedure
CSFB_Call	RTT1X_CS_CallType	CSFB by a (pre-)registered UE If the call Type is mt, CDMA SS sends 1x RTT GCSNA encapsulated General Page to be tunnelled in DLInformation Transfer SS is expected to send InitialAccessProbeRcvd and CS_CallCmplInd as an indication for successful completion of procedure
CS_Reg_CSFB _Call	RTT1X CS CallType	UE not previously pre-registered hence performs registration (Power up attach) and CSFB call Registration can be implicit registration SS is expected to send InitialAccessProbeRcvd and CS_Reg_CallCmplInd as an indication for successful completion of procedure
MobilityFromE UTRA_1XRTT	NullType	Prepare SS for Mobility from Eutra CDMA SS sends mobilityParameters to be tunnelled in HandoverFromEUTRAPreparationRequest Receive tunnelled 1xRTT GCSNA Encapsulated Origination message and MEID in ULHandoverPreparationTransfer Respond with GCSNA encapsulated 1xRTT Handoff Direction message to be sent tunnelled in MobilityFromEUTRACommand Receive HandoffCmpl in the 1xRTT Cell; SS is expected to send HandoffCmpl as an indication for successful completion of procedure
CS_OrderedRe gistration	CS_Registration_Type	ordered registration on (already registered) 1xRTT cell or Pre registration Power up attach) through a different RAT. SS triggers the procedure by sending Registration Request order (GCSNA encapsulated in case of pre-registration) and sends mobilityParameters to be tunnelled in CSFBParametersRequestCDMA2000 SS is expected to send InitialAccessProbeRcvd (only if initial state is not pre-registration) and CS_RegistrationCmpl as an indication for successful completion of procedure
E_CSFB_Call	RTT1X_CS_CallType	Prepare SS for Enhanced CSFB call If the call Type is mt, CDMA SS sends 1x RTT GCSNA encapsulated General Page to be tunneled in DLInformation Transfer CDMA SS sends mobilityParameters to be tunneled in HandoverFromEUTRAPreparationRequest Receive tunneled 1xRTT GCSNA Encapsulated Origination (M0)/Page Response (MT) message and MEID in ULHandoverPreparationTransfer Respond with GCSNA encapsulated 1xRTT Handoff Direction message to be sent tunneled in MobilityFromEUTRACommand Receive HandoffCmpl in the 1xRTT Cell; SS responds with Alert With Information (MT)/Sevice connect (MO) in the 1xRTT cell. SS receives Connect order (MT)/Service Connect Completion (MO)

SS is expected to send ECSFB_CallCmplInd as an indication
for succesful completion of procedure
Prepare SS for Enhanced CSFB call with Extended channel assignment
If the call Type is mt, CDMA SS sends 1x RTT GCSNA
encapsulated General Page to be tunneled in DLInformation Transfer
CDMA SS sends mobilityParameters to be tunneled in
HandoverFromEUTRAPreparationRequest
Receive tunneled 1xRTT GCSNA Encapsulated Origination
(M0)/Page Response (MT) message and MEID in
ÜLHandoverPreparationTransfer
Respond with GCSNA Encapsulated ECAM message to be
sent tunneled in MobilityFromEUTRACommand
Receive Origination in the 1xRTT Cell;
After extended channel assignment, SS receives Connect order
(MT)/Service Connect Completion (MO) SS is expected to send ECSFB_ECAM_CallCmplInd as an
indication for succesful completion of procedure
Prepare SS for Enhanced CSFB call, which needs to be rejected If the call Type is mt, CDMA SS sends 1x RTT GCSNA
encapsulated General Page to be tunneled in DLInformation
Transfer
CDMA SS sends mobilityParameters to be tunneled in
HandoverFromEUTRAPreparationRequest
Receive tunneled 1xRTT GCSNA Encapsulated Origination
(M0)/Page Response (MT) message and MEID in
ULHandoverPreparationTransfer
Respond with GCSNA encapsulated 1xRTT Release Order
message to be sent tunneled in DLInformation Transfer SS is expected to send ECSFB_CallRejInd as an indication for
succesful completion of procedure

CONNECTION_REQUEST

TTCN-3 Record Type		
Name	CONNECTION_REQUEST	
Comment	clause 7.4.6.2.2	
Messageld	MessageId_Type	The access terminal shall set this field to 0x01
TransactionId	TransactionId Type	The access terminal shall increment this value for each new
		ConnectionRequest message sent
RequestReaso	B4 Type	0x0 Access Terminal Initiated
n		0x1 Access Network Initiated
Reserved	B4 Type	The access terminal shall set this field to zero.
		The access network shall ignore this field.

Pilot

TTCN-3 Record		
Name	Pilot	
Comment		
PilotPN	B9 Type	The access network shall set this field to the PN Offset associated with the sector that will transmit a Power Control Channel to the access terminal, to whom the access terminal is allowed to point its DRC, and whose Control Channel and Forward Traffic Channel the access terminal may monitor.
SoftHandoff	B1_Type	If the Forward Traffic Channel associated with this pilot will carry the same closed-loop power-control bits as that of the previous pilot in this message, the access network shall set this field to '1'; otherwise, the access network shall set this field to '0'. The access network shall set the first instance of this field to '0'. If the SofterHandoff field associated with a PilotPN is equal to '1', then the PilotPN is defined to belong to the same cell as the previous PilotPN in this message
MACIndexLSB s	B6_Type	Least Significant Bits of the Medium Access Control Index. The access network shall set this field to the six least significant bits of the MACIndex assigned to the access terminal by this sector
DRCCover	B3 Type	The access network shall set this field to the index of the DRC cover associated with the sector specified in this record.
RABLength	B2 Type	If the traffic channel being assigned by this message is to use Subtype 0 or Subtype 1 Reverse Traffic Channel MAC protocol, the access network shall set the RABLength to specify the Reverse Activity Bit length according to Table 9.7.6.2-2. Otherwise, the access network shall set this field to '00'. '00':8,'01':16,'10:32,'11':64
RABOffset	B3_Type	If the traffic channel being assigned 1 by this message is to use Subtype 0 or Subtype 1 Reverse Traffic Channel MAC protocol, the access network shall set this field to indicate the offset associated with the Reverse Activity Bit. Otherwise, the access network shall set this field to '000'. The value (in slots) of RABOffset is the number the field is set to multiplied by RABLength/8

ROUTE_UPDATE

TTCN-3 Record Type		
Name	ROUTE_UPDATE	
Comment	clause 8.7.6.2.1	
Messageld	Messageld Type	The access network shall set this field to '00'O
MessageSeque	B8 Type	The access terminal shall set this field to the sequence number
nce		of this message. The sequence number of this message is 1
		more than the sequence number
		of the last RouteUpdate message (modulo 284)sent by this
		access terminal. If this is the first RouteUpdate message sent by
ReferencePilot	DO Type	the access terminal, it shall set this field to 0x00 The access terminal shall set this field to the access terminal's
	B9 Type	
PN		time reference (the reference pilot), relative to the zero offset
Defense a Dilet	DO Torre	pilot PN sequence in units of 64 PN chips.
ReferencePilot	B6 Type	The access terminal shall set this field to - 2 * 10 * log10PS ,
Strength		where PS is the strength of the reference pilot, measured as specified in 8.7.6.1.2.3.
		If this value is less than 0, the access terminal shall set this field
		to '000000'. If this value is greater than '111111', the access
		terminal shall set this field to '111111'.
ReferenceKeep	B1_Type	If the pilot drop timer corresponding to the reference pilot has
		expired, the access terminal shall set this field to '0'; otherwise,
		the access terminal shall set this field to '1'.
NumPilots	B4_Type	The access terminal shall set this field to the number of pilots
		that follow this field in the message
PilotsRecList	<u>PilotRecList</u>	Pilot record
Reserved	<u>ReservedVariable</u>	The number of bits in this field is equal to the number needed to
		make the message length an integer number of octets. This field
		shall be set to all zeros

Header_Format

TTCN-3 Record	TTCN-3 Record Type			
Name	Header_Format			
Comment	When TunnelModeEnabled is not set to '0', the access terminal and the access network shall place the following header in front of each packet received from the Packet Consolidation Protocol.			
SAPState	B1 Type	The sender shall set this field to '1' if the Inter-RAT Signalling Adaptation Protocol is currently in the Open State, otherwise the sender shall set this field to '0'		
SessionConfigu rationToken	B16 Type	If SAP is in the Open State, the access terminal shall omit this field. Otherwise, the access terminal shall set this field to the value of the SessionConfigurationToken which is public data of the Session Configuration Protocol. The access network shall omit this field		
ConnectionLay erFormat	B1_Type	The access terminal or the access network shall set this field to '1' if the connection layer packet is Format B; otherwise, it shall set this field to '0'		
ATI_Record	B34_Type	Access Terminal Identifier Record. The access terminal or the access network shall set this field to the record specifying the access terminal's ID specified by TransmitATI.ATI and TransmitATI.ATIType. This record is defined in 14.2 in [1]		
Reserved	B4 Type	The access terminal or the access network shall this field to all zeros
