# ETSI TS 125 101 V5.13.0 (2004-12)

Technical Specification

Universal Mobile Telecommunications System (UMTS); User Equipment (UE) radio transmission and reception (FDD) (3GPP TS 25.101 version 5.13.0 Release 5)

Reference
RTS/TSGR-0425101v5d0

Keywords

UMTS

### Important notice

Individual copies of the present document can be downloaded from: <u>http://www.etsi.org</u>

The present document may be made available in more than one electronic version or in print. In any case of existing or perceived difference in contents between such versions, the reference version is the Portable Document Format (PDF). In case of dispute, the reference shall be the printing on ETSI printers of the PDF version kept on a specific network drive within ETSI Secretariat.

Users of the present document should be aware that the document may be subject to revision or change of status.

Information on the current status of this and other ETSI documents is available at

**DECT**<sup>TM</sup>, **PLUGTESTS**<sup>TM</sup> and **UMTS**<sup>TM</sup> are Trade Marks of ETSI registered for the benefit of its Members. **TIPHON**<sup>TM</sup> and the **TIPHON logo** are Trade Marks currently being registered by ETSI for the benefit of its Members. **3GPP**<sup>TM</sup> is a Trade Mark of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners.

# Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

### **Foreword**

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <a href="http://webapp.etsi.org/key/queryform.asp">http://webapp.etsi.org/key/queryform.asp</a>.

# **Foreword**

This Technical Specification (TS) has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

#### where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

# 1 Scope

The present document establishes the minimum RF characteristics of the FDD mode of UTRA for the User Equipment (UE).

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

# 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the following definitions apply:

**Power Spectral Density:** The units of Power Spectral Density (PSD) are extensively used in this document. PSD is a function of power versus frequency and when integrated across a given bandwidth, the function represents the mean power in such a bandwidth. When the mean power is normalised to (divided by) the chip-rate it represents the mean energy per chip. Some signals are directly defined in terms of energy per chip, (DPCH\_E<sub>c</sub>, E<sub>c</sub>, OCNS\_E<sub>c</sub> and S-CCPCH\_E<sub>c</sub>) and others defined in terms of PSD ( $I_o$ ,  $I_{oc}$ ,  $I_{or}$  and  $\hat{I}_{or}$ ). There also exist quantities that are a ratio of energy per chip to PSD (DPCH\_E<sub>c</sub>/ $I_{or}$ , E<sub>c</sub>/ $I_{or}$  etc.). This is the common practice of relating energy magnitudes in communication systems.

It can be seen that if both energy magnitudes in the ratio are divided by time, the ratio is converted from an energy ratio to a power ratio, which is more useful from a measurement point of view. It follows that an energy per chip of  $X \, dBm/3.84 \, MHz$  can be expressed as a mean power per chip of  $X \, dBm$ . Similarly, a signal PSD of  $Y \, dBm/3.84 \, MHz$  can be expressed as a signal power of  $Y \, dBm$ .

Maximum Output Power: This s a measure of the maximum power the UE can transmit (i.e. the actual power as would be measured assuming no measurement error) in a bandwidth of at least  $(1+\alpha)$  times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot.

Mean power: When applied to a W-CDMA modulated signal this is the power (transmitted or received) in a bandwidth of at least  $(1+\alpha)$  times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot unless otherwise stated.

Nominal Maximum Output Power: This is the nominal power defined by the UE power class.

**RRC** filtered mean power: The mean power as measured through a root raised cosine filter with roll-off factor α and a bandwidth equal to the chip rate of the radio access mode.

NOTE 1: The RRC filtered mean power of a perfectly modulated W-CDMA signal is 0.246 dB lower than the mean power of the same signal.

NOTE 2: The roll-off factor  $\alpha$  is defined in section 6.8.1.

Throughput: Number of information bits per second excluding CRC bits successfully received on HS-DSCH by a HSDPA capable UE.

#### 3.2 **Abbreviations**

**HARQ** 

Hybrid ARQ sequence

For the purposes of the present document, the following abbreviations apply:

| ACLR                                     | Adjacent Channel Leakage power Ratio  |
|--|---|
| ACS                                      | Adjacent Channel Selectivity  |
| AICH                                     | Acquisition Indication Channel  |
| BER                                      | Bit Error Ratio   |
| BLER                                     | Block Error Ratio   |
| CQI                                      | Channel Quality Indicator   |
| CW                                       | Continuous Wave (un-modulated signal)   |
| DCH                                      | Dedicated Channel, which is mapped into Dedicated Physical Channel.                                   |
| DL                                       | Down Link (forward link)  |
| DTX                                      | Discontinuous Transmission  |
| DPCCH                                    | Dedicated Physical Control Channel  |
| DPCH                                     | Dedicated Physical Channel  |
| $DPCHE_{c}$                              | Average energy per PN chip for DPCH.  |
| $DPCH_E_c$                               | The ratio of the transmit energy per PN chip of the DPCH to the total transmit power spectral         |
| $\overline{\mathrm{I}}_{\mathrm{or}}$    |   |
|  | density at the Node B antenna connector.  |
| DPDCH                                    | Dedicated Physical Data Channel   |
| EIRP                                     | Effective Isotropic Radiated Power  |
| $\mathbf{E}_{\mathrm{c}}$                | Average energy per PN chip.   |
| $\frac{\mathrm{E_{c}}}{\mathrm{I_{or}}}$ | The ratio of the average transmit energy per PN chip for different fields or physical channels to the |
|  | total transmit power spectral density.  |
| FACH                                     | Forward Access Channel  |
| FDD                                      | Frequency Division Duplex   |
| FDR                                      | False transmit format Detection Ratio. A false Transport Format detection occurs when the             |
|  | receiver detects a different TF to that which was transmitted, and the decoded transport block(s)     |
|  | for this incorrect TF passes the CRC check(s).  |
| $F_{uw}$                                 | Frequency of unwanted signal. This is specified in bracket in terms of an absolute frequency(s) or    |
|  | a frequency offset from the assigned channel frequency.   |
| HSDPA                                    | High Speed Downlink Packet Access   |
| HS-DSCH                                  | High Speed Downlink Shared Channel  |
| HS-PDSCH                                 | High Speed Physical Downlink Shared Channel   |

Information Data Rate

Rate of the user information, which must be transmitted over the Air Interface. For example,

output rate of the voice codec.

 $I_{o}$  The total received power spectral density, including signal and interference, as measured at the UE

antenna connector.

 $I_{oc}$  The power spectral density (integrated in a noise bandwidth equal to the chip rate and normalized

to the chip rate) of a band limited white noise source (simulating interference from cells, which are

not defined in a test procedure) as measured at the UE antenna connector.

 $I_{or}$  The total transmit power spectral density (integrated in a bandwidth of  $(1+\alpha)$  times the chip rate

and normalized to the chip rate)of the downlink signal at the Node B antenna connector.

 $\hat{I}_{or}$  The received power spectral density (integrated in a bandwidth of  $(1+\alpha)$  times the chip rate and

normalized to the chip rate) of the downlink signal as measured at the UE antenna connector.

MER Message Error Ratio

Node B A logical node responsible for radio transmission / reception in one or more cells to/from the User

Equipment. Terminates the Iub interface towards the RNC

OCNS Orthogonal Channel Noise Simulator, a mechanism used to simulate the users or control signals on

the other orthogonal channels of a downlink link.

OCNS\_E Average energy per PN chip for the OCNS.

OCNS\_E<sub>c</sub> The ratio of the average transmit energy per PN chip for the OCNS to the total transmit power

 $I_{or}$ 

spectral density.

P-CCPCH Primary Common Control Physical Channel

PCH Paging Channel

 $P-CCPCH = \frac{E_c}{L}$  The ratio of the received P-CCPCH energy per chip to the total received power spectral density at

the UE antenna connector.

 $\underline{P-CCPCH_{-}E_{c}}$  The ratio of the average transmit energy per PN chip for the P-CCPCH to the total transmit power

 $I_{or}$  spectral density.

P-CPICH Primary Common Pilot Channel
PICH Paging Indicator Channel

PPM Parts Per Million

R Number of information bits per second excluding CRC bits successfully received on HS-DSCH by

a HSDPA capable UE.

<REFSENS> Reference sensitivity

 $\langle \text{REF } \hat{\mathbf{I}}_{or} \rangle$  Reference  $\hat{\mathbf{I}}_{or}$ 

RACH Random Access Channel

SCH Synchronization Channel consisting of Primary and Secondary synchronization channels

S-CCPCH Secondary Common Control Physical Channel.  $S-CCPCH_{-}E_{c}$  Average energy per PN chip for S-CCPCH.

SIR Signal to Interference ratio

SSDT Site Selection Diversity Transmission
STTD Space Time Transmit Diversity
TDD Time Division Duplexing
TFC Transport Format Combination

TFCI Transport Format Combination Indicator

TPC Transmit Power Control

TSTD Time Switched Transmit Diversity

UE User Equipment
UL Up Link (reverse link)

UTRA UMTS Terrestrial Radio Access

### 4 General

# 4.1 Relationship between Minimum Requirements and Test Requirements

The Minimum Requirements given in this specification make no allowance for measurement uncertainty. The test specification 34.121 Annex F defines Test Tolerances. These Test Tolerances are individually calculated for each test. The Test Tolerances are used to relax the Minimum Requirements in this specification to create Test Requirements.

The measurement results returned by the test system are compared – without any modification - against the Test Requirements as defined by the shared risk principle.

The Shared Risk principle is defined in ETR 273 Part 1 sub-part 2 section 6.5.

#### 4.2 Power Classes

For UE power classes 1 and 2, a number of RF parameter are not specified. It is intended that these are part of a later release.

# 4.3 Control and monitoring functions

This requirement verifies that the control and monitoring functions of the UE prevent it from transmitting if no acceptable cell can be found by the UE.

### 4.3.1 Minimum requirement

The power of the UE, as measured with a thermal detector, shall not exceed -30dBm if no acceptable cell can be found by the UE.

# 5 Frequency bands and channel arrangement

#### 5.1 General

The information presented in this subclause is based on a chip rate of 3.84 Mcps.

NOTE: Other chip rates may be considered in future releases.

# 5.2 Frequency bands

a) UTRA/FDD is designed to operate in either of the following paired bands:

Table 5.0: UTRA FDD frequency bands

| Operating                        | UL Frequencies  | DL frequencies              |  |  |
|----------------------------------|-----------------|-----------------------------|--|--|
| Band UE transmit, Node B receive |                 | UE receive, Node B transmit |  |  |
| I                                | 1920 – 1980 MHz | 2110 –2170 MHz              |  |  |
| II                               | 1850 –1910 MHz  | 1930 –1990 MHz              |  |  |
| III                              | 1710-1785 MHz   | 1805-1880 MHz               |  |  |

b) Deployment in other frequency bands is not precluded

# 5.3 TX–RX frequency separation

a) UTRA/FDD is designed to operate with the following TX-RX frequency separation

Table 5.0A: TX-RX frequency separation

| Operating Band | TX-RX frequency separation |
|----------------|----------------------------|
| I              | 190 MHz                    |
| II             | 80 MHz.                    |
| III            | 95 MHz.                    |

- b) UTRA/FDD can support both fixed and variable transmit to receive frequency separation.
- c) The use of other transmit to receive frequency separations in existing or other frequency bands shall not be precluded.

### 5.4 Channel arrangement

### 5.4.1 Channel spacing

The nominal channel spacing is 5 MHz, but this can be adjusted to optimise performance in a particular deployment scenario.

#### 5.4.2 Channel raster

The channel raster is  $200\,\text{kHz}$ , which for all bands except Band II means that the centre frequency must be an integer multiple of  $200\,\text{kHz}$ . In Band II , 12 additional centre frequencies are specified according to the table in 5.4.3 and the centre frequencies for these channels are shifted  $100\,\text{kHz}$  relative to the normal raster.

#### 5.4.3 Channel number

The carrier frequency is designated by the UTRA Absolute Radio Frequency Channel Number (UARFCN). The UARFCN values are defined as follows:

**Table 5.1: UARFCN definition** 

|   | UARFCN                                     | Carrier frequency [MHz]  |
|---|--|--|
| Uplink $N_u = 5 * F_{uplink}$ $0.0 \text{ MHz} \le F_{uplink} \le 3276.6 \text{ MHz}$ |  | $0.0 \text{ MHz} \le F_{\text{uplink}} \le 3276.6 \text{ MHz}$ |
|   |  | where F <sub>uplink</sub> is the uplink frequency in MHz       |
| Downlink  | N <sub>d</sub> = 5 * F <sub>downlink</sub> | $0.0 \text{ MHz} \le F_{downlink} \le 3276.6 \text{ MHz}$      |
|   |  | where F <sub>downlink</sub> is the downlink frequency in MHz   |

Table 5.1A: UARFCN definition (Band II additional channels)

|          | UARFCN  | Carrier frequency [MHz]                                |
|----------|---|--|
| Uplink   | $N_u = 5 * (F_{uplink} - 1850.1 \text{ MHz})$   | F <sub>uplink</sub> =1852.5, 1857.5, 1862.5, 1867.5,   |
|          |   | 1872.5, 1877.5, 1882.5, 1887.5, 1892.5,                |
|          |   | 1897.5, 1902.5, 1907.5                                 |
| Downlink | $N_u = 5 * (F_{downlink} - 1850.1 \text{ MHz})$ | F <sub>downlink</sub> =1932.5, 1937.5, 1942.5, 1947.5, |
|          |   | 1952.5, 1957.5, 1962.5, 1967.5, 1972.5,                |
|          |   | 1977.5, 1982.5, 1987.5                                 |

#### **5.4.4 UARFCN**

The following UARFCN range shall be supported for each paired band

**Table 5.2: UTRA Absolute Radio Frequency Channel Number** 

| Operating | Uplink                      | Downlink                    |  |  |  |
|-----------|-----------------------------|-----------------------------|--|--|--|
| Band      | UE transmit, Node B receive | UE receive, Node B transmit |  |  |  |
| [         | 9612 to 9888                | 10562 to 10838              |  |  |  |
| II        | 9262 to 9538                | 9662 to 9938                |  |  |  |
|           | and                         | and                         |  |  |  |
|           | 12, 37, 62, 87,             | 412, 437, 462, 487,         |  |  |  |
|           | 112, 137, 162, 187,         | 512, 537, 562, 587,         |  |  |  |
|           | 212, 237, 262, 287          | 612, 637, 662, 687          |  |  |  |
| III       | 8562 to 8913                | 9037 to 9388                |  |  |  |

# 6 Transmitter characteristics

### 6.1 General

Unless otherwise stated the transmitter characteristic are specified at the antenna connector of the UE. For UE with integral antenna only, a reference antenna with a gain of 0 dBi is assumed. Transmitter characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

# 6.2 Transmit power

# 6.2.1 UE maximum output power

The following Power Classes define the nominal maximum output power. The nominal power defined is the broadband transmit power of the UE, i.e. the power in a bandwidth of at least  $(1+\alpha)$  times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot.

**Table 6.1: UE Power Classes** 

| Operating | Power Class 1 |       | Power Class 2 |       | Power Class 3 |       | Power Class 4 |       |
|-----------|---------------|-------|---------------|-------|---------------|-------|---------------|-------|
| Band      | Power         | Tol   | Power         | Tol   | Power         | Tol   | Power         | Tol   |

| Band III  | -             | -     | -             | -     | +24           | +1/-3 | +21           | +2/-2 |

NOTE: The tolerance allowed for the nominal maximum output power applies even for the multi-code transmission mode.

# 6.2.2 UE maximum output power with HS-DPCCH

For all values of  $\beta_{hs}$  defined in [8] the UE maximum output powers as specified in Table 6.1A are applicable in the case when the HS-DPCCH is fully or partially transmitted during a DPCCH timeslot. In DPCCH time slots, where HS-DPCCH is not transmitted, the UE maximum output power shall fulfil the requirements specified in Table 6.1.

Table 6.1A: UE maximum output powers with HS-DPCCH

|   | Power          | Class 3     | Power Class 4  |             |  |
|---|----------------|-------------|----------------|-------------|--|
| Ratio of $oldsymbol{eta}_c$ to $oldsymbol{eta}_d$ for all values of $oldsymbol{eta}_{hs}$ | Power<br>(dBm) | Tol<br>(dB) | Power<br>(dBm) | Tol<br>(dB) |  |
| $1/15 \le \beta_0/\beta_d \le 12/15$  | +24            | +1/-3       | +21            | +2/-2       |  |
| $13/15 \le \beta_c/\beta_d \le 15/8$  | +23            | +2/-3       | +20            | +3/-2       |  |
| $15/7 \le \beta_c/\beta_d \le 15/0$   | +22            | +3/-3       | +19            | +4/-2       |  |

# 6.3 Frequency Error

The UE modulated carrier frequency shall be accurate to within  $\pm 0.1$  PPM observed over a period of one timeslot compared to the carrier frequency received from the Node B. For the PRACH and PCPCH preambles the measurement interval is lengthened to 3904 chips (being the 4096 chip nominal preamble period less a 25  $\mu$ s transient period allowance at each end of the burst). These signals will have an apparent error due to Node B frequency error and Doppler shift. In the later case, signals from the Node B must be averaged over sufficient time that errors due to noise or interference are allowed for within the above  $\pm 0.1$ PPM figure. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

# 6.4 Output power dynamics

Power control is used to limit the interference level.

### 6.4.1 Open loop power control

Open loop power control is the ability of the UE transmitter to sets its output power to a specific value. The open loop power control tolerance is given in Table 6.3

#### 6.4.1.1 Minimum requirement

The UE open loop power is defined as the mean power in a timeslot or ON power duration, whichever is available.

Table 6.3: Open loop power control tolerance

| Conditions         | Tolerance |
|--------------------|-----------|
| Normal conditions  | ± 9 dB    |
| Extreme conditions | ± 12 dB   |

# 6.4.2 Inner loop power control in the uplink

Inner loop power control in the Uplink is the ability of the UE transmitter to adjust its output power in accordance with one or more TPC commands received in the downlink.

#### 6.4.2.1 Power control steps

The power control step is the change in the UE transmitter output power in response to a single TPC command, TPC\_cmd, derived at the UE.

#### 6.4.2.1.1 Minimum requirement

The UE transmitter shall have the capability of changing the output power with a step size of 1, 2 and 3 dB according to the value of  $\Delta_{TPC}$  or  $\Delta_{RP-TPC}$ , in the slot immediately after the TPC\_cmd can be derived

a) The transmitter output power step due to inner loop power control shall be within the range shown in Table 6.4.

b) The transmitter average output power step due to inner loop power control shall be within the range shown in Table 6.5. Here a TPC\_cmd group is a set of TPC\_cmd values derived from a corresponding sequence of TPC commands of the same duration.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from  $25\mu s$  before the slot boundary to  $25\mu s$  after the slot boundary.

Transmitter power control range 1 dB step size 3 dB step size 2 dB step size TPC\_ cmd Lower Upper Lower Upper Lower Upper +0.5 dB +1.5 dB +4.5 dB +1 dB +3 dB +1.5 dB + 1 0 -0.5 dB +0.5 dB -0.5 dB +0.5 dB +0.5 dB -0.5 dB -1.5 dB -3 dB -0.5 dB -1 dB -1 -1.5 dB -4.5 dB

Table 6.4: Transmitter power control range

Table 6.5: Transmitter aggregate power control range

| TPC_ cmd   | Transmitter power control range after 10 equal TPC_ cmd groups |                               |        | Transmitter control rangequal TPC_ | •      |        |
|------------|--|-------------------------------|--------|------------------------------------|--------|--------|
|            | 1 dB ste   | 1 dB step size 2 dB step size |        | 3 dB step size                     |        |        |
|            | Lower  | Upper                         | Lower  | Upper                              | Lower  | Upper  |
| +1         | +8 dB  | +12 dB                        | +16 dB | +24 dB                             | +16 dB | +26 dB |
| 0          | -1 dB  | +1 dB                         | -1 dB  | +1 dB                              | -1 dB  | +1 dB  |
| -1         | -8 dB  | -12 dB                        | -16 dB | -24 dB                             | -16 dB | -26 dB |
| 0,0,0,0,+1 | +6 dB  | +14 dB                        | N/A    | N/A                                | N/A    | N/A    |
| 0,0,0,0,-1 | -6 dB  | -14 dB                        | N/A    | N/A                                | N/A    | N/A    |

The UE shall meet the above requirements for inner loop power control over the power range bounded by the Minimum output power as defined in subclause 6.4.3, and the Maximum output power supported by the UE (i.e. the actual power as would be measured assuming no measurement error). This power shall be in the range specified for the power class of the UE in subclause 6.2.1.

# 6.4.3 Minimum output power

The minimum controlled output power of the UE is when the power is set to a minimum value.

#### 6.4.3.1 Minimum requirement

The minimum output power is defined as the mean power in one time slot. The minimum output power shall be less than -50 dBm.

### 6.4.4 Out-of-synchronization handling of output power

The UE shall monitor the DPCCH quality in order to detect a loss of the signal on Layer 1, as specified in TS 25.214. The thresholds  $Q_{out}$  and  $Q_{in}$  specify at what DPCCH quality levels the UE shall shut its power off and when it shall turn its power on respectively. The thresholds are not defined explicitly, but are defined by the conditions under which the UE shall shut its transmitter off and turn it on, as stated in this subclause.

The DPCCH quality shall be monitored in the UE and compared to the thresholds  $Q_{out}$  and  $Q_{in}$  for the purpose of monitoring synchronization. The threshold  $Q_{out}$  should correspond to a level of DPCCH quality where no reliable detection of the TPC commands transmitted on the downlink DPCCH can be made. This can be at a TPC command error ratio level of e.g. 30%. The threshold  $Q_{in}$  should correspond to a level of DPCCH quality where detection of the TPC commands transmitted on the downlink DPCCH is significantly more reliable than at  $Q_{out}$ . This can be at a TPC command error ratio level of e.g. 20%.

#### 6.4.4.1 Minimum requirement

When the UE estimates the DPCCH quality over the last 160 ms period to be worse than a threshold  $Q_{out}$ , the UE shall shut its transmitter off within 40 ms. The UE shall not turn its transmitter on again until the DPCCH quality exceeds an acceptable level  $Q_{in}$ . When the UE estimates the DPCCH quality over the last 160 ms period to be better than a threshold  $Q_{in}$ , the UE shall again turn its transmitter on within 40 ms.

The UE transmitter shall be considered 'off' if the transmitted power is below the level defined in subclause 6.5.1 (Transmit off power). Otherwise the transmitter shall be considered as 'on'.

#### 6.4.4.2 Test case

This subclause specifies a test case, which provides additional information for how the minimum requirement should be interpreted for the purpose of conformance testing.

The quality levels at the thresholds  $Q_{out}$  and  $Q_{in}$  correspond to different signal levels depending on the downlink conditions DCH parameters. For the conditions in Table 6.6, a signal with the quality at the level  $Q_{out}$  can be generated by a DPCCH\_Ec/Ior ratio of -25 dB, and a signal with  $Q_{in}$  by a DPCCH\_Ec/Ior ratio of -21 dB. The DL reference measurement channel (12.2) kbps specified in subclause A.3.1 and with static propagation conditions. The downlink physical channels, other than those specified in Table 6.6, are as specified in Table C.3 of Annex C.

Figure 6.1 shows an example scenario where the DPCCH\_Ec/Ior ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below  $Q_{out}$  where the UE shall shut its power off and then back up to a level above  $Q_{in}$  where the UE shall turn the power back on.

Unit Parameter Value dΒ  $\hat{I}_{or}/I_{oc}$ -1  $I_{oc}$ dBm/3.84 MHz -60  $DPDCH \_E_c$ See figure 6.1: Before point A -16.6 dB After point A Not defined  $\overline{D}PCCH \_E_c$ dB See figure 6.1  $I_{o}$ Information Data Rate kbps 12.2

Table 6.6: DCH parameters for the Out-of-synch handling test case

Figure 6.1: Test case for out-of-synch handling in the UE

In this test case, the requirements for the UE are that:

- 1. The UE shall not shut its transmitter off before point B.
- 2. The UE shall shut its transmitter off before point C, which is  $T_{\rm off} = 200$  ms after point B.
- 3. The UE shall not turn its transmitter on between points C and E.
- 4. The UE shall turn its transmitter on before point F, which is  $T_{on} = 200$  ms after point E.

# 6.5 Transmit ON/OFF power

# 6.5.1 Transmit OFF power

Transmit OFF power is defined as the RRC filtered mean power when the transmitter is off. The transmit OFF power state is when the UE does not transmit except during UL compressed mode.

#### 6.5.1.1 Minimum requirement

The transmit OFF power is defined as the RRC filtered mean power in a duration of at least one timeslot excluding any transient periods. The requirement for the transmit OFF power shall be less than -56 dBm.

#### 6.5.2 Transmit ON/OFF Time mask

The time mask for transmit ON/OFF defines the ramping time allowed for the UE between transmit OFF power and transmit ON power. Possible ON/OFF scenarios are RACH ,CPCH or UL compressed mode.

#### 6.5.2.1 Minimum requirement

The transmit power levels versus time shall meet the mask specified in figure 6.2 for PRACH preambles and CPCH preambles, and the mask in figure 6.3 for all other cases. The off signal is defined as the RRC filtered mean power. The on signal is defined as the mean power.

The specification depends on each possible case.

- First preamble of RACH/CPCH: Open loop accuracy (Table 6.3).
- During preamble ramping of the RACH/CPCH, and between final RACH/CPCH preamble and RACH/CPCH message part: Accuracy depending on size of the required power difference.(Table 6.7). The step in total transmitted power between final RACH/CPCH preamble and RACH/CPCH message (control part + data part) shall be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.
- After transmission gaps in compressed mode: Accuracy as in Table 6.9.
- Power step to Maximum Power: Maximum power accuracy (Table 6.1).

Figure 6.2: Transmit ON/OFF template for PRACH preambles and CPCH preambles

Figure 6.3: Transmit ON/OFF template for all other On/Off cases

Table 6.7: Transmitter power difference tolerance for RACH/CPCH preamble ramping, and between final RACH/CPCH preamble and RACH/CPCH message part

| Power step size (Up or down)* | Transmitter power difference |
|-------------------------------|------------------------------|
| ΔP [dB]                       | tolerance [dB]               |
| 0                             | +/- 1                        |
| 1                             | +/- 1                        |
| 2                             | +/- 1.5                      |
| 3                             | +/- 2                        |
| 4 ≤ Δ P ≤10                   | +/- 2.5                      |
| 11 ≤ Δ P ≤15                  | +/- 3.5                      |
| 16 ≤ Δ P ≤20                  | +/- 4.5                      |
| 21 ≤ Δ P                      | +/- 6.5                      |

NOTE: Power step size for RACH/CPCH preamble ramping is from 1 to 8 dB with 1 dB steps.

### 6.5.3 Change of TFC

A change of TFC (Transport Format Combination) in uplink means that the power in the uplink varies according to the change in data rate. DTX, where the DPDCH is turned off, is a special case of variable data, which is used to minimise the interference between UE(s) by reducing the UE transmit power when voice, user or control information is not present.

### 6.5.3.1 Minimum requirement

A change of output power is required when the TFC, and thereby the data rate, is changed. The ratio of the amplitude between the DPDCH codes and the DPCCH code will vary. The power step due to a change in TFC shall be calculated in the UE so that the power transmitted on the DPCCH shall follow the inner loop power control. The step in total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the power step, given the step size, is specified in Table 6.8. The power change due to a change in TFC is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from  $25\mu s$  before the slot boundary to  $25\mu s$  after the slot boundary.

Table 6.8: Transmitter power step tolerance

| Power step size (Up or down)<br>ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---------------------------------------|
| 0                                       | +/- 0.5                               |
| 1                                       | +/- 0.5                               |
| 2                                       | +/- 1.0                               |
| 3                                       | +/- 1.5                               |
| 4 ≤ Δ P ≤10                             | +/- 2.0                               |
| 11 ≤ Δ P ≤15                            | +/- 3.0                               |
| 16 ≤ Δ P ≤20                            | +/- 4.0                               |
| 21 ≤ Δ P                                | +/- 6.0                               |

The transmit power levels versus time shall meet the mask specified in Figure 6.4.

Figure 6.4: Transmit template during TFC change

### 6.5.4 Power setting in uplink compressed mode

Compressed mode in uplink means that the power in uplink is changed.

#### 6.5.4.1 Minimum requirement

A change of output power is required during uplink compressed frames since the transmission of data is performed in a shorter interval. The ratio of the amplitude between the DPDCH codes and the DPCCH code will also vary. The power step due to compressed mode shall be calculated in the UE so that the energy transmitted on the pilot bits during each transmitted slot shall follow the inner loop power control.

Thereby, the power during compressed mode, and immediately afterwards, shall be such that the mean power of the DPCCH follows the steps due to inner loop power control combined with additional steps of  $10\text{Log}_{10}(N_{\text{pilot.prev}}/N_{\text{pilot.curr}})$  dB where  $N_{\text{pilot.prev}}$  is the number of pilot bits in the previously transmitted slot, and  $N_{\text{pilot.curr}}$  is the current number of pilot bits per slot.

The resulting step in total transmitted power (DPCCH +DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the power step, given the step size, is specified in Table 6.8 in subclause 6.5.3.1. The power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, when neither the original timeslot nor the reference timeslot are in a transmission gap. The transient duration is not included, and is from 25µs before the slot boundary to 25µs after the slot boundary.

In addition to any power change due to the ratio  $N_{pilot,prev}$  /  $N_{pilot,curr}$ , the mean power of the DPCCH in the first slot after a compressed mode transmission gap shall differ from the mean power of the DPCCH in the last slot before the transmission gap by an amount  $\Delta_{RESUME}$ , where  $\Delta_{RESUME}$  is calculated as described in clause 5.1.2.3 of TS 25.214.

The resulting difference in the total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power difference exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the resulting difference in the total transmitted power (DPCCH + DPDCH) after a transmission gap of up to 14 slots shall be as specified in Table 6.9.

| Power difference (Up or down) ΔP [dB] | Transmitter power step tolerance after a transmission gap [dB] |
|---------------------------------------|--|
| Δ P ≤ 2                               | +/- 3  |
| 3                                     | +/- 3  |
| 4 ≤ Δ P ≤10                           | +/- 3.5  |
| 11 ≤ Δ P ≤15                          | +/- 4  |
| 16 ≤ Δ P ≤20                          | +/- 4.5  |

Table 6.9: Transmitter power difference tolerance after a transmission gap of up to 14 slots

The power difference is defined as the difference between the mean power of the original (reference) timeslot before the transmission gap and the mean power of the target timeslot after the transmission gap, not including the transient durations. The transient durations at the start and end of the transmission gaps are each from  $25\mu s$  before the slot boundary to  $25\mu s$  after the slot boundary.

+/- 6.5

The transmit power levels versus time shall meet the mask specified in figure 6.5.

 $21 \le \Delta P$ 

Figure 6.5: Transmit template during Compressed mode

#### 6.5.5 HS-DPCCH

The transmission of Ack/Nack or CQI over HS-DPCCH causes the transmission power in the uplink to vary.

#### 6.5.5.1 Minimum requirement

A change of output power is required when Ack/Nack or CQI is transmitted. The ratio of the amplitude between the DPCCH and the Ack/Nack and CQI respectively is signalled by the higher layers. The sum power on DPCCH+DPDCH shall not change by the transmission of Ack/Nack and CQI unless UE output power when Ack/Nack or CQI is transmitted would exceed the maximum value specified in Table 6.1A whereupon the UE shall apply additional scaling to the total transmit power as defined in section 5.1.2.6 of TS.25.214. The sum in total transmitted power (DPCCH + DPDCH+HS-DPCCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the power step, given the step size, is specified in Table 6.9A. The power change due to transmission of Ack/Nack or CQI is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target

timeslot, not including the transient duration. The transient duration is from  $25\mu s$  before the HS-DPCCH slot boundary to  $25\mu s$  after the HS-DPCCH slot boundary.

Table 6.9A: Transmitter power step tolerance

| Power step size (Up or down)<br>ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---------------------------------------|
| 0                                       | +/- 0.5                               |
| 1                                       | +/- 0.5                               |
| 2                                       | +/- 1.0                               |
| 3                                       | +/- 1.5                               |
| 4 ≤ Δ P ≤ 7                             | +/- 2.0                               |

The transmit power levels versus time shall meet the mask specified in Figure 6.x.

Figure 6.5A: Transmit template during Ack/Nack transmission

Figure 6.5B: Transmit template during CQI transmission

# 6.6 Output RF spectrum emissions

### 6.6.1 Occupied bandwidth

Occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum, centered on the assigned channel frequency. The occupied channel bandwidth shall be less than 5 MHz based on a chip rate of 3.84 Mcps.

#### 6.6.2 Out of band emission

Out of band emissions are unwanted emissions immediately outside the nominal channel resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit is specified in terms of a spectrum emission mask and Adjacent Channel Leakage power Ratio.

#### 6.6.2.1 Spectrum emission mask

The spectrum emission mask of the UE applies to frequencies, which are between 2.5 MHz and 12.5 MHz away from the UE centre carrier frequency. The out of channel emission is specified relative to the RRC filtered mean power of the UE carrier.

#### 6.6.2.1.1 Minimum requirement

The power of any UE emission shall not exceed the levels specified in Table 6.10. The absolute requirement is based on a -50 dBm/3.84 MHz minimum power threshold for the UE. This limit is expressed for the narrower measurement bandwidths as -55.8 dBm/1 MHz and -71.1 dBm/30 kHz. The requirements are applicable for all values of  $\beta_c$ ,  $\beta_d$  and  $\beta_{hs}$  as specified in [8].

Minimum requirement (Note 2) Band I, II, III Δf in MHz Additional Measurement requirements (Note 1) bandwidth **Absolute** Band II (Note 3) (Note 6) Relative requirement requirement 30 kHz dBc2.5 - 3.5 -71.1 dBm -15 dBm (Note 4) 1 MHz 3.5 - 7.5-55.8 dBm -13 dBm (Note 5) 1 MHz 7.5 - 8.5-55.8 dBm -13 dBm (Note 5) 1 MHz 8.5 - 12.5 MHz -49 dBc -55.8 dBm -13 dBm (Note 5)

**Table 6.10: Spectrum Emission Mask Requirement** 

24

- Note 1:  $\Delta f$  is the separation between the carrier frequency and the centre of the measurement bandwidth.
- Note 2: The minimum requirement for bands I, II & III is calculated from the relative requirement or the absolute requirement, whichever is the higher power.
- Note 3: For operation in Band II only, the minimum requirement is calculated from the minimum requirement calculated in Note 2 or the additional requirement for band II, whichever is the lower power.
- Note 4: The first and last measurement position with a 30 kHz filter is at  $\Delta f$  equals to 2.515 MHz and 3.485 MHz.
- Note 5: The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz.
- Note 6: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

### 6.6.2.2 Adjacent Channel Leakage power Ratio (ACLR)

Adjacent Channel Leakage power Ratio (ACLR) is the ratio of the RRC filtered mean power centered on the assigned channel frequency to the RRC filtered mean power centered on an adjacent channel frequency.

#### 6.6.2.2.1 Minimum requirement

If the adjacent channel power is greater than -50 dBm then the ACLR shall be higher than the value specified in Table 6.11. The requirements are applicable for all values of  $\beta_c$ ,  $\beta_d$  and  $\beta_{hs}$  as specified in [8].

Table 6.11: UE ACLR

| Power Class | Adjacent channel frequency relative to assigned channel frequency | ACLR limit |
|-------------|---|------------|
| 3           | + 5 MHz or – 5 MHz  | 33 dB      |
| 3           | + 10 MHz or – 10 MHz  | 43 dB      |
| 4           | + 5 MHz or – 5 MHz  | 33 dB      |
| 4           | + 10 MHz or -10 MHz   | 43 dB      |

- NOTE 1: The requirement shall still be met in the presence of switching transients.
- NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.
- NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

### 6.6.3 Spurious emissions

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out of band emissions.

The frequency boundary and the detailed transitions of the limits between the requirement for out band emissions and spectrum emissions are based on ITU-R Recommendations SM.329 [2].

#### 6.6.3.1 Minimum requirement

These requirements are only applicable for frequencies which are greater than 12.5 MHz away from the UE centre carrier frequency.

Table 6.12: General spurious emissions requirements

| Frequency Bandwidth   | Measurement Bandwidth | Minimum requirement |
|-----------------------|-----------------------|---------------------|
| 9 kHz ≤ f < 150 kHz   | 1 kHz                 | -36 dBm             |
| 150 kHz ≤ f < 30 MHz  | 10 kHz                | -36 dBm             |
| 30 MHz ≤ f < 1000 MHz | 100 kHz               | -36 dBm             |
| 1 GHz ≤ f < 12.75 GHz | 1 MHz                 | -30 dBm             |

Table 6.13: Additional spurious emissions requirements

| Operating Band | Frequency Bandwidth  | Measurement<br>Bandwidth | Minimum requirement |
|----------------|--|--------------------------|---------------------|
| I              | 925 MHz ≤ f ≤ 935 MHz  | 100 kHz                  | -67 dBm *           |
|                | 935 MHz < f ≤ 960 MHz  | 100 kHz                  | -79 dBm *           |
|                | 1805 MHz ≤ f ≤ 1880 MHz  | 100 kHz                  | -71 dBm *           |
|                | 1893.5 MHz <f<1919.6 mhz<="" th=""><th>300 kHz</th><th>-41 dBm</th></f<1919.6> | 300 kHz                  | -41 dBm             |
| II             | -  | -                        | -                   |
| III            | 925 MHz ≤ f ≤ 935 MHz  | 100 kHz                  | -67 dBm *           |
|                | 935 MHz < f ≤ 960 MHz  | 100 kHz                  | -79 dBm *           |
|                | 2110 MHz ≤ f ≤ 2170 MHz  | 3.84 MHz                 | -60 dBm *           |

The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in Table 6.12 are permitted for each UARFCN used in the measurement

#### 6.7 Transmit intermodulation

The transmit intermodulation performance is a measure of the capability of the transmitter to inhibit the generation of signals in its non linear elements caused by presence of the wanted signal and an interfering signal reaching the transmitter via the antenna.

# 6.7.1 Minimum requirement

User Equipment(s) transmitting in close vicinity of each other can produce intermodulation products, which can fall into the UE, or Node B receive band as an unwanted interfering signal. The UE intermodulation attenuation is defined by the ratio of the RRC filtered mean power of the wanted signal to the RRC filtered mean power of the intermodulation product when an interfering CW signal is added at a level below the wanted signal.

The requirement of transmitting intermodulation for a carrier spacing of 5 MHz is prescribed in Table 6.14.

Table 6.14: Transmit Intermodulation

| Interference Signal Frequency Offset | 5MHz   | 10MHz  |
|--------------------------------------|--------|--------|
| Interference CW Signal Level         | -40dBc |        |
| Intermodulation Product              | -31dBc | -41dBc |

### 6.8 Transmit modulation

Transmit modulation defines the modulation quality for expected in-channel RF transmissions from the UE. The requirements apply to all transmissions including the PRACH/PCPCH pre-amble and message parts and all other expected transmissions. In cases where the mean power of the RF signal is allowed to change versus time e.g. PRACH, DPCH in compressed mode, change of TFC and inner loop power control, the EVM and Peak Code Domain Error requirements do not apply during the 25 us period before and after the nominal time when the power is expected to change.

### 6.8.1 Transmit pulse shape filter

The transmit pulse shaping filter is a root-raised cosine (RRC) with roll-off  $\alpha = 0.22$  in the frequency domain. The impulse response of the chip impulse filter  $RC_0(t)$  is:

$$RC_0(t) = \frac{\sin\left(\pi \frac{t}{T_c} (1 - \alpha)\right) + 4\alpha \frac{t}{T_c} \cos\left(\pi \frac{t}{T_c} (1 + \alpha)\right)}{\pi \frac{t}{T_c} \left(1 - \left(4\alpha \frac{t}{T_c}\right)^2\right)}$$

Where the roll-off factor  $\alpha = 0.22$  and the chip duration is

$$T = \frac{1}{chiprate} \approx 0.26042 \ \mu s$$

# 6.8.2 Error Vector Magnitude

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Both waveforms pass through a matched Root Raised Cosine filter with bandwidth 3,84 MHz and roll-off  $\alpha$ =0,22. Both waveforms are then further modified by selecting the frequency, absolute phase, absolute amplitude and chip clock timing so as to minimise the error vector. The EVM result is defined as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25  $\mu$ s at each end of the slot. For the PRACH and PCPCH preambles the measurement interval is 4096 chips less 25  $\mu$ s at each end of the burst (3904 chips).

#### 6.8.2.1 Minimum requirement

The Error Vector Magnitude shall not exceed 17.5 % for the parameters specified in Table 6.15. The requirements are applicable for all values of  $\beta_c$ ,  $\beta_d$  and  $\beta_{hs}$  as specified in [8].

Table 6.15: Parameters for Error Vector Magnitude/Peak Code Domain Error

| Parameter               | Unit | Level             |
|-------------------------|------|-------------------|
| UE Output Power         | dBm  | ≥ –20             |
| Operating conditions    |      | Normal conditions |
| Power control step size | dB   | 1                 |

#### 6.8.3 Peak code domain error

The Peak Code Domain Error is computed by projecting power of the error vector (as defined in 6.8.2) onto the code domain at a specific spreading factor. The Code Domain Error for every code in the domain is defined as the ratio of the mean power of the projection onto that code, to the mean power of the composite reference waveform. This ratio is expressed in dB. The Peak Code Domain Error is defined as the maximum value for the Code Domain Error for all codes. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 µs at each end of the slot.

The requirement for peak code domain error is only applicable for multi-code DPDCH transmission and therefore does not apply for the PRACH and PCPCH preamble and message parts.

#### 6.8.3.1 Minimum requirement

The peak code domain error shall not exceed -15 dB at spreading factor 4 for the parameters specified in Table 6.15. The requirements are defined using the UL reference measurement channel specified in subclause A.2.5.

### 6.8.4 Phase discontinuity

Phase discontinuity is the change in phase between any two adjacent timeslots. The EVM for each timeslot (excluding the transient periods of 25 us on either side of the nominal timeslot boundaries), shall be measured according to subclause 6.8.2. The frequency, absolute phase, absolute amplitude and chip clock timing used to minimise the error vector are chosen independently for each timeslot. The phase discontinuity result is defined as the difference between the absolute phase used to calculate EVM for the preceding timeslot, and the absolute phase used to calculate EVM for the succeeding timeslot.

### 6.8.4.1 Minimum requirement

The rate of occurrence of any phase discontinuity on an uplink DPCH for the parameters specified in table 6.16 shall not exceed the values specified in table 6.17. Phase shifts that are caused by changes of the UL transport format combination (TFC) and compressed mode are not included. When calculating the phase discontinuity, the requirements for frequency error and EVM in subclauses 6.3 and 6.8.2 for each timeslot shall be met.

**Table 6.16: Parameters for Phase discontinuity** 

| Parameter               | Unit | Level |
|-------------------------|------|-------|
| Power control step size | dB   | 1     |

Table 6.17: Phase discontinuity minimum requirement

| Phase discontinuity Δθ in degrees | Maximum allowed rate of occurrence in Hz |
|-----------------------------------|--|
| $\Delta\theta \leq 30$            | 1500                                     |
| $30 < \Delta\theta \le 60$        | 300                                      |
| Δθ > 60                           | 0  |

# 7 Receiver characteristics

### 7.1 General

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. Receiver characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

All the parameters in clause 7 are defined using the DL reference measurement channel (12.2 kbps) specified in clause A.3.1 and unless otherwise stated with DL power control OFF.

# 7.2 Diversity characteristics

A suitable receiver structure using coherent reception in both channel impulse response estimation and code tracking procedures is assumed. Three forms of diversity are considered to be available in UTRA/FDD.

Table 7.1: Diversity characteristics for UTRA/FDD

| Time diversity          | Channel coding and interleaving in both up link and down link  |
|-------------------------|--|
| Multi-path<br>diversity | Rake receiver or other suitable receiver structure with maximum combining. Additional processing elements can increase the delay-spread performance due to increased capture of signal energy. |
| Antenna diversity       | Antenna diversity with maximum ratio combing in the Node B and optionally in the UE. Possibility for downlink transmit diversity in the Node B.  |

# 7.3 Reference sensitivity level

The reference sensitivity level <REFSENS> is the minimum mean power received at the UEantenna port at which the Bit Error Ratio (BER) shall not exceed a specific value.

### 7.3.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.2.

Table 7.2: Test parameters for reference sensitivity

| Operating Band  | Unit         | DPCH_Ec <refsens></refsens> | <refî<sub>or&gt;</refî<sub> |  |
|---|--------------|-----------------------------|-----------------------------|--|
| 1   | dBm/3.84 MHz | -117                        | -106.7                      |  |
| II  | dBm/3.84 MHz | -115                        | -104.7                      |  |
| III dBm/3.84 MHz -114 -103.7  |              |                             |                             |  |
| NOTE 1. For Power class 3 this shall be at the maximum output power |              |                             |                             |  |
| NOTE 2. For Power class 4 this shall be at the maximum output power |              |                             |                             |  |

# 7.4 Maximum input level

This is defined as the maximum mean power received at the UE antenna port, at which the specified BER performance shall be met.

# 7.4.1 Minimum requirement for DPCH reception

The BER shall not exceed 0.001 for the parameters specified in Table 7.3.

Table 7.3: Maximum input level

| Parameter                 | Unit         | Level  |
|---------------------------|--------------|--|
| $\frac{DPCH\_Ec}{I_{or}}$ | dB           | -19  |
| Î <sub>or</sub>           | dBm/3.84 MHz | -25  |
| UE transmitted mean power | dBm          | 20 (for Power class 3)<br>18 (for Power class 4) |

NOTE: Since the spreading factor is large (10log(SF)=21dB), the majority of the total input signal consists of the OCNS interference. The structure of OCNS signal is defined in Annex C.3.2.

### 7.4.2 Minimum requirement for HS-PDSCH reception

### 7.4.2.1 Minimum requirement for 16QAM

For the parameters specified in Table 7.3A, the requirements are specified in terms of a minimum information bit throughput R as shown in Table 7.3B for the DL reference channel H-Set 1 specified in Annex A.7.1.1. with the addition of the parameters added in the end of Table 7.3A and downlink physical channel setup according to Annex C.5.

Table 7.3A

| Parameter                            | Unit           | Test                   |
|--------------------------------------|----------------|------------------------|
| Phase reference                      |                | P-CPICH                |
| Î <sub>or</sub>                      | dBm/3.84 MHz   | -25 *                  |
| UE transmitted mean                  | dBm            | 20 (for Power class 3) |
| power                                | UDIII          | 18 (for Power class 4) |
| DPCH                                 | DPCH_Ec/lor    | -13                    |
| HS-SCCH_1                            | HS-SCCH_Ec/lor | -13                    |
| Redundancy and constellation version |                | 6                      |
| Maximum number of                    |                | 1                      |
| HARQ transmissions                   |                | l                      |

Note: The HS-DSCH shall be transmitted continuously with constant power but only every third TTI shall be sent to the UE under test.

Table 7.3B

| $\begin{array}{c} \textbf{HS-PDSCH} \\ E_c/I_{or} \ \ \textbf{(dB)} \end{array}$ | T-put R (kbps) * |  |
|--|------------------|--|
| -3   | 700              |  |

# 7.5 Adjacent Channel Selectivity (ACS)

Adjacent Channel Selectivity (ACS) is a measure of a receiver"s ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

# 7.5.1 Minimum requirement

The UE shall fulfil the minimum requirement specified in Table 7.4 for all values of an adjacent channel interferer up to –25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5 where the BER shall not exceed 0.001.

**Table 7.4: Adjacent Channel Selectivity** 

| Power Class | Unit | ACS |
|-------------|------|-----|
| 3           | dB   | 33  |
| 4           | dB   | 33  |

Table 7.5: Test parameters for Adjacent Channel Selectivity

| Parameter                               | Unit         | Case 1   | Case 2   |
|---|--------------|--|--|
| DPCH_Ec                                 | dBm/3.84 MHz | <refsens> + 14 dB</refsens>                      | <refsens> + 41 dB</refsens>                      |
| Î <sub>or</sub>                         | dBm/3.84 MHz | <refî<sub>or&gt; + 14 dB</refî<sub>              | REFÎ <sub>or</sub> > + 41 dB                     |
| I <sub>oac</sub> mean power (modulated) | dBm          | -52  | -25  |
| F <sub>uw</sub> (offset)                | MHz          | +5 or -5   | +5 or -5   |
| UE transmitted mean power               | dBm          | 20 (for Power class 3)<br>18 (for Power class 4) | 20 (for Power class 3)<br>18 (for Power class 4) |

NOTE: The  $I_{oac}$  (modulated) signal consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.

# 7.6 Blocking characteristics

The blocking characteristic is a measure of the receiver"s ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

### 7.6.1 Minimum requirement (In-band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.6.

Table 7.6: In-band blocking

| Parameter                                    | Unit         | Level   |  |
|--|--------------|---|--|
| DPCH_Ec                                      | dBm/3.84 MHz | <refsens>+3 dB</refsens>  |  |
| Î <sub>or</sub>                              | dBm/3.84 MHz | <refî<sub>or&gt; + 3 dB</refî<sub>  |  |
| I <sub>blocking</sub> mean power (modulated) | dBm          | -56 -44<br>(for F <sub>uw</sub> offset ±10 MHz) (for F <sub>uw</sub> offset ±15 M |  |
| UE transmitted mean power                    | dBm          | 20 (for Power class 3)<br>18 (for Power class 4)                                  |  |

Note: I<sub>blocking</sub> (modulated) consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.

# 7.6.2 Minimum requirement (Out of-band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.7. For Table 7.7 up to 24 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

Table 7.7: Out of band blocking

| Parameter                               | Unit   | Frequency range 1   | Frequency range 2                              | Frequency range 3                  |
|---|--|---|--|------------------------------------|
| DPCH_Ec                                 | dBm/3.84<br>MHz  | <refsens>+3 dB</refsens>  | <refsens>+3 dB</refsens>                       | <refsens>+3 dB</refsens>           |
| Îor                                     | dBm/3.84<br>MHz  | <refî<sub>or&gt; + 3 dB</refî<sub>  | <refî<sub>or&gt; + 3 dB</refî<sub>             | <refî<sub>or&gt; + 3 dB</refî<sub> |
| Iblocking (CW)                          | dBm  | -44   | -30  | -15                                |

| Band III operation                      | For 1790 ≤ f ≤ 1895 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 7.5.1 and subclause 7.6.2 shall be applied. |   |  |                                    |

# 7.6.3 Minimum requirement (Narrow band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.7A. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing

Table 7.7A: Narrow band blocking characteristics

| Parameter                    | Unit         | Band II                             | Band III                            |
|------------------------------|--------------|-------------------------------------|-------------------------------------|
| DPCH_Ec                      | dBm/3.84 MHz | <refsens> + 10 dB</refsens>         | <refsens> + 10 dB</refsens>         |

| I <sub>blocking</sub> (GMSK) | dBm          | -57                                 | -56                                 |
| F <sub>uw</sub> (offset)     | MHz          | 2.7                                 | 2.8                                 |
| UE transmitted mean          | dBm          | 20 (for Power class 3)              |                                     |
| power                        | UDIII        | 18 (for Pow                         | er class 4)                         |

NOTE:  $I_{blocking}(GMSK)$  is an interfering signal as defined in TS 45.004 [6]

# 7.7 Spurious response

Spurious response is a measure of the receiver"s ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 7.6.2 is not met.

### 7.7.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.8.

**Table 7.8: Spurious Response** 

| Unit         | Level  |
|--------------|--|
| dBm/3.84 MHz | <refsens> +3 dB</refsens>                        |
| dBm/3.84 MHz | <refî<sub>or&gt; +3 dB</refî<sub>                |
| dBm          | -44  |
| MHz          | Spurious response frequencies                    |
| dBm          | 20 (for Power class 3)<br>18 (for Power class 4) |
|              | dBm/3.84 MHz<br>dBm/3.84 MHz<br>dBm<br>MHz       |

### 7.8 Intermodulation characteristics

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receiver a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

### 7.8.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.9.

Table 7.9: Receive intermodulation characteristics

| Parameter                                | Unit         | Level  |                              |
|--|--------------|--|------------------------------|
| DPCH_Ec                                  | dBm/3.84 MHz | <refsen< td=""><td>NS&gt; +3 dB</td></refsen<> | NS> +3 dB                    |

| F <sub>uw2</sub> (offset) | MHz          | 5.9  | -5.9        | 6.0   | -6.0                  |
| UE transmitted mean       | dBm          |  | 20 (for Pov | wer class 3)                                    | •                     |
| power                     | иын          |  | 18 (for Pov | wer class 4)                                    |                       |

NOTE: I<sub>ouw2</sub> (GMSK) is an interfering signal as defined in TS 45.004 [6].

# 7.9 Spurious emissions

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector.

### 7.9.1 Minimum requirement

The power of any narrow band CW spurious emission shall not exceed the maximum level specified in Table 7.10 and Table 7.11

Table 7.10: General receiver spurious emission requirements

| Frequency Band       | Measurement<br>Bandwidth | Maximum<br>level | Note |
|----------------------|--------------------------|------------------|------|
| 30MHz ≤ f < 1GHz     | 100 kHz                  | -57 dBm          |      |
| 1GHz ≤ f ≤ 12.75 GHz | 1 MHz                    | -47 dBm          |      |

Table 7.11: Additional receiver spurious emission requirements

| Band | Frequency Band          | Measurement<br>Bandwidth | Maximum<br>level | Note   |
|------|-------------------------|--------------------------|------------------|--|
| 1    | 1920 MHz ≤ f ≤ 1980 MHz | 3.84 MHz                 | -60 dBm          | UE transmit band in URA_PCH, Cell_PCH and idle state |
|      | 2110 MHz ≤ f ≤ 2170 MHz | 3.84 MHz                 | -60 dBm          | UE receive band                                      |
| II   | 1850 MHz ≤ f ≤ 1910 MHz | 3.84 MHz                 | -60 dBm          | UE transmit band in URA_PCH, Cell_PCH and idle state |
|      | 1930 MHz ≤ f ≤ 1990 MHz | 3.84 MHz                 | -60 dBm          | UE receive band                                      |
| III  | 1710 MHz ≤ f ≤ 1785 MHz | 3.84 MHz                 | -60 dBm          | UE transmit band in URA_PCH, Cell_PCH and idle state |
|      | 1805 MHz ≤ f ≤ 1880 MHz | 3.84 MHz                 | -60 dBm          | UE receive band                                      |

# 8 Performance requirement

### 8.1 General

The performance requirements for the UE in this subclause are specified for the measurement channels specified in Annex A, the propagation conditions specified in Annex B and the Down link Physical channels specified in Annex C. Unless stated DL power control is OFF.

### 8.2 Demodulation in static propagation conditions

### 8.2.1 (void)

### 8.2.2 Demodulation of Forward Access Channel (FACH)

void

### 8.2.3 Demodulation of Dedicated Channel (DCH)

The receive characteristic of the Dedicated Channel (DCH) in the static environment is determined by the Block Error Ratio (BLER). BLER is specified for each individual data rate of the DCH. DCH is mapped into the Dedicated Physical Channel (DPCH).

### 8.2.3.1 Minimum requirement

For the parameters specified in Table 8.5 the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.6. These requirements are applicable for TFCS size 16.

Table 8.5: DCH parameters in static propagation conditions

| Parameter             | Unit         | Test 1 | Test 2 | Test 3 | Test 4 |
|-----------------------|--------------|--------|--------|--------|--------|
| Phase reference       |              |        | P-CI   | PICH   |        |
| $\hat{I}_{or}/I_{oc}$ | dB           |        | -      | 1      |        |
| $I_{oc}$              | dBm/3.84 MHz |        | -6     | 60     |        |
| Information Data Rate | kbps         | 12.2   | 64     | 144    | 384    |

Table 8.6: DCH requirements in static propagation conditions

| Test Number | $\frac{DPCH\_E_c}{I_{or}}$ | BLER             |
|-------------|----------------------------|------------------|
| 1           | -16.6 dB                   | 10 <sup>-2</sup> |
| 2           | -13.1 dB                   | 10 <sup>-1</sup> |
|             | -12.8 dB                   | 10 <sup>-2</sup> |
| 0           | -9.9 dB                    | 10 <sup>-1</sup> |
| 3           | -9.8 dB                    | 10 <sup>-2</sup> |
| 4           | -5.6 dB                    | 10 <sup>-1</sup> |
| 4           | -5.5 dB                    | 10 <sup>-2</sup> |

# 8.3 Demodulation of DCH in multi-path fading propagation conditions

# 8.3.1 Single Link Performance

The receive characteristics of the Dedicated Channel (DCH) in different multi-path fading environments are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into in Dedicated Physical Channel (DPCH).

### 8.3.1.1 Minimum requirement

For the parameters specified in Table 8.7, 8.9 , 8.11, 8.13 and 8.14A the average downlink  $\frac{DPCH_{-}E_{c}}{I_{-}}$  power ratio shall

be below the specified value for the BLER shown in Table 8.8, 8.10, 8.12, 8.14 and 8.14B. For the parameters specified in Table 8.14C and 8.14 E the downlink  $\frac{DPCH_E_c}{I_{or}}$  power ratio measured values, which are averaged over one slot,

shall be below the specified value in Table 8.14D and 8.14F more than 90% of the time. These requirements are applicable for TFCS size 16.

Table 8.7: Test Parameters for DCH in multi-path fading propagation conditions (Case 1)

| Parameter             | Unit         | Test 1  | Test 2 | Test 3 | Test 4 |
|-----------------------|--------------|---------|--------|--------|--------|

# 8.4 Demodulation of DCH in moving propagation conditions

### 8.4.1 Single link performance

The receive single link performance of the Dedicated Channel (DCH) in dynamic moving propagation conditions are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

#### 8.4.1.1 Minimum requirement

For the parameters specified in Table 8.15 the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.16.

Table 8.15: DCH parameters in moving propagation conditions

| Parameter             | Unit         | Test 1  | Test 2 |
|-----------------------|--------------|---------|--------|
| Phase reference       |              | P-CPICH |        |

# 8.5 Demodulation of DCH in birth-death propagation conditions

# 8.5.1 Single link performance

The receive single link performance of the Dedicated Channel (DCH) in dynamic birth-death propagation conditions are determined by the Block Error Ratio (BLER) values. BER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

### 8.5.1.1 Minimum requirement

For the parameters specified in Table 8.17 the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.18.

Table 8.17: DCH parameters in birth-death propagation conditions

| Parameter             | Unit         | Test 1  | Test 2 |
|-----------------------|--------------|---------|--------|
| Phase reference       |              | P-CPICH |        |
| $\hat{I}_{or}/I_{oc}$ | dB           |         | -1     |

| 1           | -12.6 dB                   | 10 <sup>-2</sup> |
| 2           | -8.7 dB                    | 10 <sup>-2</sup> |

# 8.6 Demodulation of DCH in downlink Transmit diversity modes

### 8.6.1 Demodulation of DCH in open-loop transmit diversity mode

The receive characteristic of the Dedicated Channel (DCH) in open loop transmit diversity mode is determined by the Block Error Ratio (BLER). DCH is mapped into in Dedicated Physical Channel (DPCH).

### 8.6.1.1 Minimum requirement

For the parameters specified in Table 8.19 the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.20.

Table 8.19: Test parameters for DCH reception in an open loop transmit diversity scheme. (Propagation condition: Case 1)

| Parameter             | Unit         | Test 1  |
|-----------------------|--------------|---------|
| Phase reference       |              | P-CPICH |
| $\hat{I}_{or}/I_{oc}$ | dB           | 9       |
| $I_{oc}$              | dBm/3.84 MHz | -60     |

| Test Nu  | mber       | $\frac{DPCH\_E_c}{I_{or}}$ (see note) | BLER             |
|--|------------|---------------------------------------|------------------|
| 1  |            | -18.0 dB                              | 10 <sup>-2</sup> |
| 2  | 2 -18.3 dB |                                       | 10 <sup>-2</sup> |
| NOTE: This is the total power from both antennas. Power sharing between antennas are feedback mode dependent as specified in TS25.214. |            |                                       |                  |

# 8.6.3 Demodulation of DCH in Site Selection Diversity Transmission Power Control mode

The bit error characteristics of UE receiver is determined in Site Selection Diversity Transmission power control (SSDT) mode. Two Node B emulators are required for this performance test. The delay profiles of signals received from different Node Bs are assumed to be the same but time shifted by 10 chip periods (2604 ns).

#### 8.6.3.1 Minimum requirements

The downlink physical channels and their relative power to Ior are the same as those specified in clause C.3.2 irrespective of Node Bs and the test cases. DPCH\_Ec/Ior value applies whenever DPDCH in the cell is transmitted. In Test 1 and Test 3, the received powers at UE from two Node Bs are the same, while 3dB offset is given to one that comes from one of Node Bs for Test 2 and Test 4 as specified in Table 8.23.

For the parameters specified in Table 8.23 the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.24.

Table 8.23: DCH parameters in multi-path propagation conditions during SSDT mode (Propagation condition: Case 1)

| Parameter                                | Unit         | Test 1 | Test 2     | Test 3 | Test 4     |

### 8.7 Demodulation in Handover conditions

### 8.7.1 Demodulation of DCH in Inter-Cell Soft Handover

The bit error rate characteristics of UE is determined during an inter-cell soft handover. During the soft handover a UE receives signals from different cells. A UE has to be able to demodulate two PCCPCH channels and to combine the energy of DCH channels. Delay profiles of signals received from different cells are assumed to be the same but time shifted by 10 chips.

The receive characteristics of the different channels during inter-cell handover are determined by the average Block Error Ratio (BLER) values.

### 8.7.1.1 Minimum requirement

For the parameters specified in Table 8.25 the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.26.

Table 8.25: DCH parameters in multi-path propagation conditions during Soft Handoff (Case 3)

| Parameter   | Unit         | Test 1 | Test 2 | Test 3 | Test 4 |
|---|--------------|--------|--------|--------|--------|
| Phase reference                                   |              |        | P-(    | CPICH  |        |

# 8.7.2 Combining of TPC commands from radio links of different radio link sets

### 8.7.2.1 Minimum requirement

Test parameters are specified in Table 8.27. The delay profiles of the signals received from the different cells are the same but time-shifted by 10 chips.

For Test 1, the sequence of uplink power changes between adjacent slots shall be as shown in Table 8.28 over the 4 consecutive slots more than 99% of the time. Note that this case is without an additional noise source  $I_{\rm oc}$ .

For Test 2, the Cell1 and Cell2 TPC patterns are repeated a number of times. If the transmitted power of a given slot is increased compared to the previous slot, then a variable "Transmitted power UP" is increased by one, otherwise a variable "Transmitted power DOWN" is increased by one. The requirements for "Transmitted power UP" and "Transmitted power DOWN" are shown in Table 8.28A.

Table 8.27: Parameters for TPC command combining

| Parameter                           | Unit         | Test 1                              | Test 2                   |

# 8.7.3 Combining of reliable TPC commands from radio links of different radio link sets

#### 8.7.3.1 Minimum requirement

Test 1 verifies that the UE follows only the reliable TPC commands in soft handover. Test 2 verifies that the UE follows all the reliable TPC commands in soft handover.

Test parameters are specified in Table 8.28B. Before the start of the tests, the UE transmit power shall be initialised to -15 dBm. An actual UE transmit power may vary from the target level of -15 dBm due to inaccurate UE output power step.

During tests 1 and 2 the UE transmit power samples, which are defined as the mean power over one timeslot, shall stay 90% of the time within the range defined in Table 8.28C.

Table 8.28B: Parameters for reliable TPC command combining

| Parameter               | Unit         | Test 1            | Test 2           |
|-------------------------|--------------|-------------------|------------------|
| Phase reference         | -            | P-CF              | PICH             |

| Information data Rate   | kbps         | 12.2              |                  |
| Propagation condition   | -            | Sta               | tic              |

Note 1: The DPCH\_Ec/lor1 is set at the level corresponding to 5% TPC error rate.

Note 2: The uplink power control from cell1 shall be such that the UE transmit power would stay at -15 dBm.

Note 3: The maximum DPCH\_Ec/lor1 level in cell1 is -9 dB.

Table 8.28C: Test requirements for reliable TPC command combining

| Parameter       | Unit | Test 1     | Test 2     |
|-----------------|------|------------|------------|
| UE output power | dBm  | -15 ± 5 dB | -15 ± 3 dB |

### 8.8 Power control in downlink

Power control in the downlink is the ability of the UE receiver to converge to required link quality set by the network while using as low power as possible in downlink. If a BLER target has been assigned to a DCCH (See Annex A.3), then it has to be such that outer loop is based on DTCH and not on DCCH.

### 8.8.1 Power control in the downlink, constant BLER target

#### 8.8.1.1 Minimum requirements

For the parameters specified in Table 8.29 the downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio measured values, which are

averaged over one slot, shall be below the specified value in Table 8.30 more than 90% of the time. BLER shall be as shown in Table 8.30. Power control in downlink is ON during the test.

Table 8.29: Test parameter for downlink power control

| Parameter                                  | Unit         | Test 1 | Test 2 |  |
|--|--------------|--------|--------|--|
| $\hat{I}_{or}/I_{oc}$                      | dB           | 9      | -1     |  |
| $I_{oc}$                                   | dBm/3.84 MHz | -60    | 0      |  |
| Information Data Rate                      | kbps         | 12.2   |        |  |
| Target quality value on DTCH               | BLER         | 0.01   |        |  |
| Propagation condition                      |              | Case   | e 4    |  |
| Maximum_DL_Power *                         | dB           | 7      |        |  |
| Minimum_DL_Power *                         | dB           | -18    | 8      |  |
| DL Power Control step size, $\Delta_{TPC}$ | dB           | 1      |        |  |
| Limited Power Increase                     | -            | "Not u | ised"  |  |

NOTE: Power is compared to P-CPICH as specified in [4].

Table 8.30: Requirements in downlink power control

| Parameter                  | Unit | Test 1   | Test 2   |
|----------------------------|------|----------|----------|
| $\frac{DPCH\_E_c}{I_{or}}$ | dB   | -16.0    | -9.0     |
| Measured quality on DTCH   | BLER | 0.01±30% | 0.01±30% |

### 8.8.2 Power control in the downlink, initial convergence

This requirement verifies that DL power control works properly during the first seconds after DPCH connection is established

### 8.8.2.1 Minimum requirements

For the parameters specified in Table 8.31 the downlink DPCH\_Ec/Ior power ratio measured values, which are averaged over 50 ms, shall be within the range specified in Table 8.32 more than 90% of the time. T1 equals to 500 ms and it starts 10 ms after uplink the DPDCH physical channel is considered. T2 equals to 500 ms and it starts when T1 has expired. Power control is ON during the test.

The first 10 ms shall not be used for averaging, ie the first sample to be input to the averaging filter is at the beginning of T1. The averaging shall be performed with a sliding rectangular window averaging filter. The window size of the averaging filter is linearly increased from 0 up to 50 ms during the first 50 ms of T1, and then kept equal to 50ms.

Table 8.31: Test parameters for downlink power control

| Parameter                    | Unit            | Test 1     | Test 2 | Test 3 | Test 4 |  |  |

| $\frac{DPCH\_E_c}{I_{or}} \text{ during T2}$ | dB   | -18.9 ≤ DPCH_Ec/lor ≤ -14.9 | -15.1 ≤ DPCH_Ec/lor ≤ -11.1 |

### 8.8.3 Power control in downlink, wind up effects

### 8.8.3.1 Minimum requirements

This test is run in three stages where stage 1 is for convergence of the power control loop, in stage two the maximum downlink power for the dedicated channel is limited not to be higher than the parameter specified in Table 8.33. All parameters used in the three stages are specified in Table 8.33. The downlink  $\underline{DPCH_{-}E_{c}}$  power ratio measured values,

which are averaged over one slot, during stage 3 shall be lower than the value specified in Table 8.34 more than 90% of the time.

Power control of the UE is ON during the test.

Table 8.33: Test parameter for downlink power control, wind-up effects

# 8.9 Downlink compressed mode

Downlink compressed mode is used to create gaps in the downlink transmission, to allow the UE to make measurements on other frequencies.

# 8.9.1 Single link performance

The receiver single link performance of the Dedicated Traffic Channel (DCH) in compressed mode is determined by the Block Error Ratio (BLER) and transmitted DPCH\_Ec/Ior power ratio in the downlink.

The compressed mode parameters are given in clause A.5. Tests 1 and 2 are using Set 1 compressed mode pattern parameters from Table A.21 in clause A.5 while tests 3 and 4 are using Set 2 compressed mode patterns from the same table.

### 8.9.1.1 Minimum requirements

For the parameters specified in Table 8.35 the downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio measured values, which are averaged

over one slot, shall be below the specified value in Table 8.36 more than 90% of the time. The measured quality on DTCH shall be as required in Table 8.36.

Downlink power control is ON during the test. Uplink TPC commands shall be error free.

Table 8.35: Test parameter for downlink compressed mode

# 8.10 Blind transport format detection

Performance of Blind transport format detection is determined by the Block Error Ratio (BLER) values and by the measured average transmitted DPCH\_Ec/Ior value.

## 8.10.1 Minimum requirement

For the parameters specified in Table 8.37 the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the specified

value for the BLER shown in Table 8.38.

Table 8.37: Test parameters for Blind transport format detection

| Parameter             | Unit         | Test 1           | Test 2           | Test 3           | Test 4           | Test 5           | Test 6           |  |  |
|-----------------------|--------------|------------------|------------------|------------------|------------------|------------------|------------------|--|--|
| $\hat{I}_{or}/I_{oc}$ | dB           |                  | -1               |                  |                  | -3               |                  |  |  |
| $I_{oc}$              | dBm/3.84 MHz |                  | -60              |                  |                  | 0                |                  |  |  |
| Information Data Rate | kbps         | 12.2<br>(rate 1) | 7.95<br>(rate 2) | 1.95<br>(rate 3) | 12.2<br>(rate 1) | 7.95<br>(rate 2) | 1.95<br>(rate 3) |  |  |

| DCCH |       |       |       |      | 2.4k |      |       |       |       |

# 8.11 Detection of Broadcast channel (BCH)

The receiver characteristics of Broadcast Channel (BCH) are determined by the Block Error Ratio (BLER) values. BCH is mapped into the primary common control physical channel (P-CCPCH).

# 8.11.1 Minimum requirement

For the parameters specified in Table 8.40 the average downlink power P-CCPCH\_Ec/Ior shall be below the specified value for the BLER shown in Table 8.41.

This requirement doesn"t need to be tested.

Table 8.40: Parameters for BCH detection

| Parameter             | Unit         | Test 1  | Test 2 |
|-----------------------|--------------|---------|--------|
| Phase reference       | -            | P-CPICH |        |
| $I_{oc}$              | dBm/3.84 MHz | -60     | )      |
| $\hat{I}_{or}/I_{oc}$ | dB           | -1      | -3     |
| Propagation condition |              | Static  | Case 3 |

Table 8.41: Test requirements for BCH detection

| Test Number | P-CCPCH_Ec/lor | BLER |
|-------------|----------------|------|
| 1           | -18.5 dB       | 0.01 |
| 2           | -12.8 dB       | 0.01 |

# 8.12 Demodulation of Paging Channel (PCH)

The receiver characteristics of paging channel are determined by the probability of missed paging message (Pm-p). PCH is mapped into the S-CCPCH and it is associated with the transmission of Paging Indicators (PI) to support efficient sleep-mode procedures.

### 8.12.1 Minimum requirement

For the parameters specified in Table 8.42 the average probability of missed paging (Pm-p) shall be below the specified value in Table 8.43. Power of downlink channels other than S-CCPCH and PICH are as defined in Table C.3 of Annex C. S-CCPCH structure is as defined in Annex A.6.

Table 8.42: Parameters for PCH detection

| Parameter                                  | Unit         | Test 1  | Test 2 |
|--|--------------|---------|--------|
| Number of paging indicators per frame (Np) | -            | 72      |        |
| Phase reference                            | -            | P-CPICH |        |
| $I_{oc}$                                   | dBm/3.84 MHz | -60     |        |
| $\hat{I}_{or}/I_{oc}$                      | dB           | -1      | -3     |
| Propagation condition                      |              | Static  | Case 3 |

Table 8.43: Test requirements for PCH detection

| Test Number | S-CCPCH_Ec/lor | PICH_Ec/lor | Pm-p |
|-------------|----------------|-------------|------|
| 1           | -14.8          | -19         | 0.01 |
| 2           | -9.8           | -12         | 0.01 |

# 8.13 Detection of Acquisition Indicator (AI)

The receiver characteristics of Acquisition Indicator (AI) are determined by the probability of false alarm Pfa and probability of correct detection Pd. Pfa is defined as a conditional probability of detection of AI signature given that a AI signature was not transmitted. Pd is defined as a conditional probability of correct detection of AI signature given that the AI signature is transmitted.

# 8.13.1 Minimum requirement

For the parameters specified in Table 8.44 the Pfa and 1-Pd shall not the exceed the specified values in Table 8.45. Power of downlink channels other than AICH is as defined in Table C.3 of Annex C.

Table 8.44: Parameters for Al detection

| Parameter   | Unit         | Test 1  |
|---|--------------|---------|
| Phase reference                                   | =            | P-CPICH |
| $I_{oc}$  | dBm/3.84 MHz | -60     |
| Number of other transmitted AI signatures on AICH | -            | 0       |
| $\hat{I}_{or}/I_{oc}$                             | dB           | -1      |
| AICH_Ec/lor                                       | dB           | -22.0   |
| AICH Power Offset                                 | dB           | -12.0   |
| Propagation condition                             | -            | Static  |

Note that AICH\_Ec/Ior can not be set. Its value is calculated from other parameters and it is given for information only. (AICH\_Ec/Ior = AICH Power Offset + CPICH\_Ec/Ior)

Table 8.45: Test requirements for AI detection

| Test Number | Pfa  | 1-Pd |
|-------------|------|------|
| 1           | 0.01 | 0.01 |

# 8.14 Detection of Access Preamble Acquisition Indicator Channel (AP-AICH)

The requirement for detection of the AP-AICH for CPCH is the same as the requirement for detection of the AI which is described in section 8.13 of this specification.

# 8.15 Detection of Collision Detection/Channel Assignment Indicator Channel (CD/CA-ICH)

The requirement for detection of the CD/CA-ICH for CPCH is the same as the requirement for detection of the AI which is described in section 8.13 of this specification.

# 8.16 Demodulation of CPCH Status Indicator Channel (CSICH)

The receive characteristics of the CPCH Status Indicator Channel (CSICH) are determined by the average message error Ratio (MER). Under the test conditions described below, a CSICH message demodulation error will cause the UE to transmit a CPCH message when there is pending UL data to transmit. MER is measured at the message rate listed for the conditions in Table 8.46.

# 8.16.1 Minimum requirement

For the parameters and conditions specified in Tables 8.46, 8.47 and 8.48 the MER shall not exceed the values listed in table 8.49.

Other downlink channels which are present in this test are P-CPICH, P-CCPCH, and PICH, and their powers are as specified in Annex C.3.2.

Table 8.46: CPCH test parameters and conditions for CSICH performance

| Parameter                                    | Test 1  | Test 2                           |  |
|--|---|----------------------------------|--|
| CPCH mode                                    | UE Channel Selection (PCPCH availability is broadcast in CSICH)                           |                                  |  |
| Number of PCPCHs in CPCH set                 | 1   | 5                                |  |
| Number of SIs per CSICH frame                | 15 (one SI mess   | age per PCPCH)                   |  |
| Number of CSICH bits per SI message          | 8 (CSICH bit repeated 8 t   | imes in each SI message)         |  |
| CSICH Message Rate                           | 750 per second (15 mes  | sages in 20 msec frame)          |  |
| AP preamble signatures                       | 15 PCPCHs are given 1 signatu   | ure each; 1 signature is unused. |  |
| AP preamble slot subchannels                 | All slot subchannels are avail  | able for access without delay.   |  |
| CD preamble signatures                       | 16 (all signatures used)  |                                  |  |
| CD preamble slot subchannels                 | All slot subchannels are available for access without delay.                              |                                  |  |
| Persistency value for all PCPCHs             | 1 (full access, no delay)   |                                  |  |
| CSICH broadcast                              | N=15 SIs. For each PCPCH SI, SI=0 (PCPCH not available)                                   |                                  |  |
| AP-AICH broadcast                            | In each access slot, Node B transmits 15 AP-AICH-ACKs, one for each PCPCH.                |                                  |  |
| Channel Assignment (CA)                      | Not a   | active                           |  |
| CD/CA-ICH broadcast                          | In each access slot, Node B transmits 16 CD/CA-ICH ACKs, one for each possible signature. |                                  |  |
| Power control preamble length for all PCPCHs | 0 slots   |                                  |  |
| Message length for all PCPCHs                | 10 ms (1 TTI) (Nfmax = 1)   |                                  |  |
| Spreading factor for all PCPCHs              | 64  |                                  |  |
| Propagation condition                        | Static Case 3   |                                  |  |

Table 8.47: AP-AICH test parameters for CSICH performance

| Parameter   | Unit         | Test 1  | Test 2 |
|---|--------------|---------|--------|
| Phase reference                                       | -            | P-CPICH |        |
| $I_{oc}$  | dBm/3.84 MHz | -60     |        |
| Number of transmitted<br>Al signatures on AP-<br>AICH | -            | 15 (al  | I ACK) |
| $\hat{I}_{or}/I_{oc}$                                 | dB           | -1      | -3     |
| AP-AICH_Ec/lor  | dB           | -10.0   |        |
| AP-AICH Power Offset                                  | dB           | 0       |        |
| Propagation condition                                 |              | Static  | Case 3 |

Note that AP-AICH\_Ec/Ior cannot be set. Its value is calculated from other parameters and it is given for information only. (AP-AICH\_Ec/Ior = AP-AICH Power Offset + CPICH\_Ec/Ior)

Table 8.48: CD/CA-ICH test parameters for CSICH performance

| Parameter  | Unit         | Test 1  | Test 2 |
|--|--------------|---------|--------|
| Phase reference  | -            | P-CPICH |        |
| $I_{oc}$   | dBm/3.84 MHz | -6      | 60     |
| Number of transmitted<br>CD signatures on<br>CD/CA-ICH | -            | 16 (all | ACK)   |
| $\hat{I}_{or}/I_{oc}$                                  | dB           | -1      | -3     |
| CD/CA-ICH_Ec/lor                                       | dB           | -10.0   |        |
| CD/CA-ICH Power<br>Offset                              | dB           | 0       |        |
| Propagation condition                                  |              | Static  | Case 3 |

Note that CD/CA-ICH\_Ec/Ior cannot be set. Its value is calculated from other parameters and it is given for information only. (CD/CA-ICH\_Ec/Ior = CD/CA-ICH Power Offset + CPICH\_Ec/Ior)

Table 8.49: CSICH demodulation requirements

| Test Number | CSICH power offset | CSICH MER |
|-------------|--------------------|-----------|
| 1           | -10.5 dB           | 0.001     |
| 2           | -3.0 dB            | 0.001     |

# 9 Performance requirement (HSDPA)

### 9.1 General

The performance requirements for the UE in this subclause apply for the reference measurement channels specified in Annex A.7, the propagation conditions specified in table B.1B of Annex B and the Down link Physical channels specified in Annex C.5.

# 9.2 Demodulation of HS-DSCH (Fixed Reference Channel)

The performance requirement for a particular UE belonging to certain HS-DSCH category are determined according to Table 9.1.

Table 9.1: Mapping between HS-DSCH category and FRC

| HS-DSCH category | Corresponding requirement |
|------------------|---------------------------|
| Category 1       | H-Set 1                   |
| Category 2       | H-Set 1                   |
| Category 3       | H-Set 2                   |
| Category 4       | H-Set 2                   |
| Category 5       | H-Set 3                   |
| Category 6       | H-Set 3                   |
| Category 11      | H-Set 4                   |
| Category 12      | H-Set 5                   |

During the Fixed Reference Channel tests the behaviour of the Node-B emulator in response to the ACK/NACK signalling field of the HS-DPCCH is specified in Table 9.1A:

Table 9.1A: Node-B Emulator Behaviour in response to ACK/NACK/DTX

| HS-DPCCH ACK/NACK<br>Field State | Node-B Emulator Behaviour   |
|----------------------------------|---|
| ACK                              | ACK: new transmission using 1 <sup>st</sup> redundancy and constellation version (RV) |
| NACK                             | NACK: retransmission using the next RV (up to the maximum permitted number or RV"s)   |
| DTX                              | DTX: retransmission using the RV previously transmitted to the same H-ARQ process     |

NOTE: Performance requirements in this section assume a sufficient power allocation to HS-SCCH\_1 so that probability of reporting DTX is very low.

# 9.2.1 Single Link performance

The receiver single link performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in different multi-path fading environments are determined by the information bit throughput R

### 9.2.1.1 Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3

For the parameters specified in Table 9.2, the requirements are specified in terms of a minimum information bit throughput R as shown in Table 9.3 for the DL reference channels specified in Annex A.7.1

Table 9.2: Test Parameters for Testing QPSK FRCs H-Set 1/H-Set 2/H-Set 3

| Parameter  | Unit         | Test 1  | Test 2 | Test 3 | Test 4 |
|--|--------------|---------|--------|--------|--------|
| Phase reference                                      |              | P-CPICH |        |        |        |
| $I_{oc}$   | dBm/3.84 MHz | -60     |        |        |        |
| Redundancy and constellation version coding sequence |              |         | {0,2   | ,5,6}  |        |
| Maximum number of HARQ transmission                  |              | 4       |        |        |        |

Table 9.3: Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3

| Test   | Propagation   |  | Reference value                                 |  |  |  |

| * Notes: | * Notes: 1) The reference value R is for the Fixed Reference Channel (FRC) H-Set 5 |                   |                              |                               |  |

## 9.2.3 Closed Loop Diversity Performance

The closed loop transmit diversity (Mode 1) performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

### 9.2.3.1 Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3

For the parameters specified in Table 9.16, the requirements are specified in terms of a minimum information bit throughput R as shown in Table 9.17 for the DL reference channels specified in Annex A.7.1.

Table 9.16: Test Parameters for Testing QPSK FRCs H-Set 1/H-Set 2/H-Set 3

| Parameter  | Unit         | Test 1    | Test 2  | Test 3 |
|--|--------------|-----------|---------|--------|
| Phase reference                                      |              |           | P-CPICH |        |
| $I_{oc}$   | dBm/3.84 MHz |           | -60     |        |
| DPCH frame offset                                    | Oh:n         |           | 0       |        |
| $(	au_{DPCH,n})$                                     | Chip         | 0         |         |        |
| Redundancy and constellation version coding sequence |              | {0,2,5,6} |         |        |
| Maximum number of HARQ transmission                  |              | 4         |         |        |
| Feedback Error Rate                                  | %            | 4         |         |        |
| Closed loop timing adjustment mode                   |              |           | 1       |        |

Table 9.17: Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3

| Test   | Propagation | Reference value  |   |  |
|--------|-------------|--|---|--|
| Number | Conditions  | $\begin{array}{c} \textbf{HS-PDSCH} \\ E_c/I_{or} \ \ \textbf{(dB)} \end{array}$ | T-put $R$ (kbps) * $\hat{I}_{or}/I_{oc}$ = 0 dB | T-put $R$ (kbps) * $\hat{I}_{or}/I_{oc}$ = 10 dB |
| 1      | PA3         | -6   | 118   | 399  |
| ı      | I PAS       | -3   | 225   | 458  |
| 2      | PB3         | -6   | 50  | 199  |
| 2      | PDS         | -3   | 173   | 301  |
| 2      | 3 VA30      | -6   | 47  | 204  |
| 3      |             | -3   | 172   | 305  |

<sup>\*</sup> Notes: 1) The reference value R is for the Fixed Reference Channel (FRC) H-Set 1

<sup>2)</sup> For Fixed Reference Channel (FRC) H-Set 2 the reference values for R should be scaled (multiplied by 1.5 and rounding to the nearest integer t-put in kbps, where values of i+1/2 are rounded up to i+1, i integer)s

<sup>3)</sup> For Fixed Reference Channel (FRC) H-Set 3 the reference values for R should be scaled (multiplied by 3 and rounding to the nearest integer t-put in kbps, where values of i+1/2 are rounded up to i+1, i integer)

### 9.2.3.2 Minimum requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/2/3

For the parameters specified in Table 9.18, the requirements are specified in terms of a minimum information bit throughput R as shown in Table 9.19 for the DL reference channels specified in Annex A.7.1.

Table 9.18: Test Parameters for Testing 16-QAM FRCs H-Set 1/H-Set 2/H-Set 3

| Parameter  | Unit         | Test 1    | Test 2  | Test 3 |
|--|--------------|-----------|---------|--------|
| Phase reference                                      |              |           | P-CPICH |        |
| $I_{oc}$   | dBm/3.84 MHz |           | -60     |        |
| DPCH frame offset                                    | Chin         |           | 0       |        |
| $(	au_{DPCH,n})$                                     | Chip         | 0         |         |        |
| Redundancy and constellation version coding sequence |              | {6,2,1,5} |         |        |
| Maximum number of<br>HARQ transmission               |              | 4         |         |        |
| Feedback Error Rate                                  | %            | 4         |         |        |
| Closed loop timing adjustment mode                   |              | 1         |         |        |

Table 9.19: Minimum requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/2/3

| Test  | Propagation | Reference value            |  |  |  |
|---|-------------|----------------------------|--|--|--|
| Number  | Conditions  | HS-PDSCH $E_c/I_{or}$ (dB) | T-put $R$ (kbps) * $\hat{I}_{or}/I_{oc}$ = 10 dB |  |  |
| 1   | PA3         | -6                         | 361  |  |  |
| ı   | PAS         | -3                         | 500  |  |  |
| 2   | PB3         | -6                         | 74   |  |  |

| 3   | 1/420       | -6                         | 84   |  |  |
| 3   | VA30        | -3                         | 254  |  |  |
| * Notes: 1)The reference value R is for the Fixed Reference Channel (FRC) H-Set 1 |             |                            |  |  |  |

\* Notes:

1) The reference value R is for the Fixed Reference Channel (FRC) H-Set 1

2) For Fixed Reference Channel (FRC) H-Set 2 the reference values for R should be scaled (multiplied by 1.5 and rounding to the nearest integer t-put in kbps, where values of i+1/2 are rounded up to i+1, i integer)

3) For Fixed Reference Channel (FRC) H-Set 3 the reference values for R should be scaled (multiplied by 3 and rounding to the nearest integer t-put in kbps, where values of i+1/2 are rounded up to i+1, i integer)

### 9.2.3.3 Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 4/5

For the parameters specified in Table 9.20, the requirements are specified in terms of a minimum information bit throughput R as shown in Tables 9.21 and 9.22 for the DL reference channels specified in Annex A.7.1.4 and A.7.1.5 respectively.

Table 9.20: Test Parameters for Testing QPSK FRCs H-Set 4/H-Set 5

| Parameter             | Unit         | Test 1    | Test 2  | Test 3 |
|-----------------------|--------------|-----------|---------|--------|
| Phase reference       |              |           | P-CPICH |        |

# 9.3 Reporting of Channel Quality Indicator

### 9.3.1 AWGN propagation conditions

The reporting accuracy of channel quality indicator (CQI) under AWGN environments is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median.

### 9.3.1.1 Minimum Requirement – UE capability categories 1-6 and 11, 12

For the parameters specified in Table 9.23, the reported CQI value shall be in the range of +/-2 of the reported median more than 90% of the time. If the HS-PDSCH BLER using transport format indicated by median CQI is less than 0.1, BLER using transport format indicated by (median CQI +2) shall be larger than 0.1. If the HS-PDSCH BLER using transport format indicated by median CQI is larger than 0.1, BLER using transport format indicated by (median CQI -1) shall be less than 0.1.

Table 9.23: Test Parameter for CQI

| Parameter  | Unit   | Test 1   | Test 2  | Test 3 |
|--|--|--|---------|--------|
| $\hat{I}_{or}/I_{oc}$  | dB   | 0  | 5       | 10     |
| $I_{oc}$   | dBm/3.84 MHz   |  | -60     |        |
| Phase reference  | -  |  | P-CPICH |        |
| $HS	ext{-}PDSCHE_c/I_{or}(^*)$   | dB   |  | -3      |        |
| HS-SCCH_1 $E_c/I_{or}$   | dB   |  | -10     |        |
| $DPCH\ E_c/I_{or}$   | dB   |  | -10     |        |
| Maximum number of<br>H-ARQ transmission  | -  | 1  |         |        |
| Number of HS-SCCH set to be monitored  | -  | 1  |         |        |
| CQI feedback cycle   | ms   |  | 2       |        |
| CQI repetition factor  | -  |  | 1       |        |
| HS-DSCH transmission pattern   | -  | 'XOOXOOX' to incorporate inter-TTI=3 UEs, where 'X' indicates TTI in which HS-PDSCH is allocated to the UE, and 'O' indicates TTI, in which HS-PDSCH is not allocated to the UE. The HS-DSCH shall be transmitted continuously with constant power |         |        |
| in [7]   | It power offset $\Gamma$ is configured by RRC accordingly and as defined |  |         |        |
| Note2: TF for HS-PDSCH is configured according to the reported CQI statistics. TF based on median CQI, median CQI -1, median CQI+2 are used. Other physical channel parameters are configured according to the CQI mapping table described in TS25.214 |  |  |         |        |

# 9.3.2 Fading propagation conditions

The reporting accuracy of the channel quality indicator (CQI) under fading environments is determined by the BLER performance using the transport format indicated by the reported CQI median.

In calculating BLER, for an HARQ process, if an odd number of consecutive DTXs are reported, the corresponding packets and one subsequent packet shall be discarded from BLER calculation. If an even number of consecutive DTXs are reported, the corresponding packets shall be discarded from BLER calculation.

The specified requirements may be subject to further simulations to verify assumptions.

### 9.3.2.1 Minimum Requirement – UE capability categories 1-6 and 11, 12

For the parameters specified in Table 9.25, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.26. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period with HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

Table 9.25: Test Parameters for CQI test in fading

| Parameter  | Unit         | Test 1 | Test 2 |  |
|--|--------------|--------|--------|--|
| $HS	ext{-}PDSCHE_c/I_{or}$ (*)   | dB           | -8     | -4     |  |
| $\hat{I}_{or}$ / $I_{oc}$  | dB           | 0      | 5      |  |
| $I_{oc}$   | dBm/3.84 MHz | -6     | 00     |  |
| Phase reference  | -            | P-CF   | PICH   |  |
| HS-SCCH_1 $E_c/I_{or}$   | dB           | -8     | .5     |  |
| DPCH $E_c/I_{or}$  | dB           | 1      | 6      |  |
| Maximum number of<br>H-ARQ transmission  | -            | 1      |        |  |
| Number of HS-SCCH set to be monitored  | -            | 1      |        |  |
| CQI feedback cycle   | ms           | 2      |        |  |
| CQI repetition factor  | -            | 1      | 1      |  |
| 'XOXOOX' to incorporate inter-TTI=3 UEs, where 'X' indicates TTI in which HS-PDSCH is allocated to the UE, and 'O' indicates TTI, in which HS-PDSCH is not allocated to the UE. The HS-DSCH shall be transmitted continuously with constant power. |              |        |        |  |
| Propagation Channel  |              |        |        |  |
| Note1: Measurement power offset '\Gamma' is configured by RRC accordingly and as defined in [7]  |              |        |        |  |

Note2: TF for HS-PDSCH is configured according to the reported CQI statistics.

TF based on median CQI is used. Other physical channel parameters are configured according to the CQI mapping table described in TS25.214

Table 9.26: Minimum requirement for CQI test in fading

| Reported CQI   | Maximum BLER |       |  |
|----------------|--------------|-------|--|
|                | Test 1       | Test2 |  |
| CQI median     | 60%          | 60%   |  |
| CQI median + 3 | 15%          | 15%   |  |

## 9.4 HS-SCCH Detection Performance

The detection performance of the HS-SCCH is determined by the probability of event  $E_{\rm m}$ , which is declared when the UE is signaled on HS-SCCH-1, but DTX is observed in the corresponding HS-DPCCH ACK/NACK field. The probability of event  $E_{\rm m}$  is denoted  $P(E_{\rm m})$ .

### 9.4.1 Minimum Requirements

For the test parameters specified in Table 9.29, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.30 the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ .

Table 9.29: Test parameters for HS-SCCH detection

| Parameter                          | Unit            | Test 1   | Test 2  | Test 3 |
|------------------------------------|-----------------|--|---------|--------|
| $I_{oc}$                           | dBm/3.84<br>MHz | -60  |         |        |
| Phase reference                    | -               |  | P-CPICH |        |
| P-CPICH $E_c/I_{or}$ (*)           | dB              | -10  |         |        |
| HS-SCCH UE Identity                |                 | HS-SCCH-1: 1010101010101010                            |         |        |
| $(x_{ue,1}, x_{ue,2},, x_{ue,16})$ |                 | (UE under test addressed solely via HS-SCCH-1)         |         |        |
| ,                                  |                 | HS-SCCH-2: 0001001010101010                            |         |        |
|                                    |                 | HS-SCCH-3: 0001101010101010                            |         |        |
|                                    |                 | HS-SCCH-4: 0001111110101010                            |         |        |
| HS-DSCH TF of UE1                  |                 | TF corresponding to CQI1                               |         |        |
| HS-SCCH-1 TTI                      | -               | 'XOOXOOX', where 'X' indicates TTI in which HS-        |         |        |
| Transmission Pattern               |                 | SCCH-1 signals the UE, and 'O' indicates no signalling |         |        |

Table 9.30: Minimum requirement for HS-SCCH detection

| Test   | Propagation | Reference value             |                            |          |

# Annex A (normative): Measurement channels

### A.1 General

The measurement channels in this annex are defined to derive the requirements in clauses 6, 7 and 8. The measurement channels represent example configuration of radio access bearers for different data rates.

The measurement channel for 12.2 kbps shall be supported by any UE both in up- and downlink. Support for other measurement channels is depending on the UE Radio Access capabilities.

### A.2 UL reference measurement channel

# A.2.1 UL reference measurement channel (12.2 kbps)

The parameters for the 12.2 kbps UL reference measurement channel are specified in Table A.1 and Table A.2. The channel coding for information is shown in figure A.1.

Table A.1: UL reference measurement channel physical parameters (12.2 kbps)

| Parameter  | Unit           | Level |  |
|--|----------------|-------|--|
| Information bit rate   | kbps           | 12.2  |  |
| DPDCH  | kbps           | 60    |  |
| DPCCH  | kbps           | 15    |  |
| DPCCH Slot Format #i   | -              | 0     |  |
| DPCCH/DPDCH power ratio  | dB             | -5.46 |  |
| TFCI   | -              | On    |  |
| Repetition   | epetition % 23 |       |  |
| NOTE: Slot Format #2 is used for closed loop tests in subclause 8.6.2. |                |       |  |

Slot Format #2 and #5 are used for site selection diversity transmission tests in subclause 8.6.3

Table A.2: UL reference measurement channel, transport channel parameters (12.2 kbps)

| Parameters                 | DTCH               | DCCH               |
|----------------------------|--------------------|--------------------|
| Transport Channel Number   | 1                  | 2                  |
| Transport Block Size       | 244                | 100                |
| Transport Block Set Size   | 244                | 100                |
| Transmission Time Interval | 20 ms              | 40 ms              |
| Type of Error Protection   | Convolution Coding | Convolution Coding |
| Coding Rate                | 1/3                | 1/3                |
| Rate Matching attribute    | 256                | 256                |
| Size of CRC                | 16                 | 12                 |

Figure A.1 (Informative): Channel coding of UL reference measurement channel (12.2 kbps)

# A.2.2 UL reference measurement channel (64 kbps)

The parameters for the 64 kbps UL reference measurement channel are specified in Table A.3 and Table A.4. The channel coding for information is shown in figure A.2. This measurement channel is not currently used in TS 25.101 but can be used for future requirements.

Table A.3: UL reference measurement channel (64 kbps)

| Parameter               | Unit | Level |
|-------------------------|------|-------|
| Information bit rate    | kbps | 64    |
| DPDCH                   | kbps | 240   |
| DPCCH                   | kbps | 15    |
| DPCCH Slot Format #i    | -    | 0     |
| DPCCH/DPDCH power ratio | dB   | -9.54 |
| TFCI                    | -    | On    |
| Repetition              | %    | 18    |

Table A.4: UL reference measurement channel, transport channel parameters (64 kbps)

| Parameter                  | DTCH         | DCCH               |
|----------------------------|--------------|--------------------|
| Transport Channel Number   | 1            | 2                  |
| Transport Block Size       | 1280         | 100                |
| Transport Block Set Size   | 1280         | 100                |
| Transmission Time Interval | 20 ms        | 40 ms              |
| Type of Error Protection   | Turbo Coding | Convolution Coding |
| Coding Rate                | 1/3          | 1/3                |
| Rate Matching attribute    | 256          | 256                |
| Size of CRC                | 16           | 12                 |

Figure A.2 (Informative): Channel coding of UL reference measurement channel (64 kbps)

# A.2.3 UL reference measurement channel (144 kbps)

The parameters for the 144 kbps UL reference measurement channel are specified in Table A.5 and Table A.6. The channel coding for information is shown in Figure A.3. This measurement channel is not currently used in the present document but can be used for future requirements.

Table A.5: UL reference measurement channel (144 kbps)

| Parameter               | Unit | Level  |
|-------------------------|------|--------|
| Information bit rate    | kbps | 144    |
| DPDCH                   | kbps | 480    |
| DPCCH                   | kbps | 15     |
| DPCCH Slot Format #i    | -    | 0      |
| DPCCH/DPDCH power ratio | dB   | -11.48 |
| TFCI                    | -    | On     |
| Repetition              | %    | 8      |

Table A.6: UL reference measurement channel, transport channel parameters (144kbps)

| Parameters                 | DTCH         | DCCH               |
|----------------------------|--------------|--------------------|
| Transport Channel Number   | 1            | 2                  |
| Transport Block Size       | 2880         | 100                |
| Transport Block Set Size   | 2880         | 100                |

# A.5 DL reference compressed mode parameters

Parameters described in Table A.21 are used in some test specified in TS 25.101 while parameters described in Table A.22 are used in some tests specified in TS 25.133.

Set 1 parameters in Table A.21 are applicable when compressed mode by spreading factor reduction is used in downlink. Set 2 parameters in Table A.21 are applicable when compressed mode by puncturing is used in downlink.

Table A.21: Compressed mode reference pattern 1 parameters

| Parameter                                     | Set 1   | Set 2      | Note                      |
|---|---------|------------|---------------------------|
| TGSN (Transmission Gap Starting Slot Number)  | 11      | 11         |                           |
| TGL1 (Transmission Gap Length 1)              | 7       | 7          |                           |
| TGL2 (Transmission Gap Length 2)              | -       | -          | Only one gap in use.      |
| TGD (Transmission Gap Distance)               | 0       | 0          | Only one gap in use.      |
| TGPL1 (Transmission Gap Pattern Length)       | 4       | 4          |                           |
| TGPL2 (Transmission Gap Pattern Length)       | -       | -          | Only one pattern in use.  |

# Annex B (normative): Propagation conditions

### B.1 General

Void

# **B.2** Propagation Conditions

## B.2.1 Static propagation condition

The propagation for the static performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this propagation model.

## B.2.2 Multi-path fading propagation conditions

Table B1 shows propagation conditions that are used for the performance measurements in multi-path fading environment. All taps have classical Doppler spectrum.

Table B.1: Propagation Conditions for Multi path Fading Environments (Cases 1 to 6)

|                           | se 1,<br>3km/h                    |                           | se 2,<br>3 km/h                   |                           | se 3,                             |                           | Cas<br>speed 2                    | ,                         |                                   |                           |                                   |

|                           |                                   | 20000                     | 0                                 | 521                       | -6                                |                           |                                   |                           | •                                 | 521                       | -6                                |
|                           |                                   |                           | •                                 | 781                       | -9                                |                           |                                   |                           |                                   | 781                       | -9                                |

NOTE: Case 5 is only used in TS25.133.

Table B.1A shows propagation conditions that are used for the performance measurements in multi-path environment when UE is informed by higher layer signalling that only DPCCH exists for channel estimation. All taps have classical Doppler spectrum. Taps are normalized to the strongest tap in the beam/sector. The actual power relation between the sector and the beam is determined by the test case.

Table B.1A: Propagation Conditions for Multi path Fading Environments (Case 7)

| Case 7, speed 50 km/h |                    |      |  |  |  |

## B.2.3 Moving propagation conditions

The dynamic propagation conditions for the test of the baseband performance are non fading channel models with two taps. The moving propagation condition has two tap, one static, Path0, and one moving, Path1. The time difference between the two paths is according Equation (B.1). The taps have equal strengths and equal phases.

Figure B.1: The moving propagation conditions

$$\Delta \tau = B + \frac{A}{2} (1 + \sin(\Delta \omega \cdot t))$$
 (B.1)

The parameters in the equation are shown in the following table.

Table B.2

| Parameter | Value                               |  |
|-----------|-------------------------------------|--|
| Α         | 5 μs                                |  |
| В         | 1 μs                                |  |
| Δω        | 40*10 <sup>-3</sup> s <sup>-1</sup> |  |

# B.2.4 Birth-Death propagation conditions

The dynamic propagation conditions for the test of the base band performance is a non fading propagation channel with two taps. The moving propagation condition has two taps, Path1 and Path2 which alternate between 'birth' and 'death'. The positions the paths appear are randomly selected with an equal probability rate and is shown in Figure B.2.

Figure B.2: Birth death propagation sequence

- 1. Two paths, Path1 and Path2 are randomly selected from the group[-5,-4,-3,-2,-1,0,1,2,3,4,5]  $\mu$ s. The paths have equal magnitudes and equal phases.
- 2. After 191 ms, Path1 vanishes and reappears immediately at a new location randomly selected from the group [-5,-4,-3,-2,-1,0,1,2,3,4,5] µs but excludes the point Path 2. The magnitudes and the phases of the tap coefficients of Path 1 and Path 2 shall remain unaltered.
- 3. After an additional 191 ms, Path2 vanishes and reappears immediately at a new location randomly selected from the group [-5,-4,-3,-2,-1,0,1,2,3,4,5] µs but excludes the point Path 1. The magnitudes and the phases of the tap coefficients of Path 1 and Path 2 shall remain unaltered.

The sequence in 2) and 3) is repeated.

# Annex C (normative): Downlink Physical Channels

### C.1 General

This annex specifies the downlink physical channels that are needed for setting a connection and channels that are needed during a connection.

# C.2 Connection Set-up

Table C.1 describes the downlink Physical Channels that are required for connection set up.

Table C.1: Downlink Physical Channels required for connection set-up

| Physical Channel |
|------------------|
| P-CPICH          |
| P-CCPCH          |
| SCH              |
| S-CCPCH          |
| PICH             |
| AICH             |
| DPCH             |

# C.3 During connection

The following clauses, describes the downlink Physical Channels that are transmitted during a connection i.e., when measurements are done. For these measurements the offset between DPCH and SCH shall be zero chips at Node B meaning that SCH is overlapping with the first symbols in DPCH in the beginning of DPCH slot structure.

### C.3.1 Measurement of Rx Characteristics

Table C.2 is applicable for measurements on the Receiver Characteristics (clause 7) with the exception of subclause 7.4 (Maximum input level).

Table C.2: Downlink Physical Channels transmitted during a connection

| Physical Channel | Power ratio                 |
|------------------|-----------------------------|
| P-CPICH          | P-CPICH_Ec / DPCH_Ec = 7 dB |
| P-CCPCH          | P-CCPCH_Ec / DPCH_Ec = 5 dB |
| SCH              | SCH_Ec / DPCH_Ec = 5 dB     |
| PICH             | PICH_Ec / DPCH_Ec = 2 dB    |
| DPCH             | Test dependent power        |

## C.3.2 Measurement of Performance requirements

Table C.3 is applicable for measurements on the Performance requirements (clause 8), including subclause 7.4 (Maximum input level) and subclause 6.4.4 (Out-of-synchronization handling of output power).

Table C.3: Downlink Physical Channels transmitted during a connection<sup>1</sup>

| Physical Channel | Power ratio  | NOTE   |
|------------------|--|--|
| P-CPICH          | P-CPICH_Ec/lor = -10 dB  | Use of P-CPICH or S-CPICH as phase reference is specified for each requirement and is also set by higher layer signalling.   |
| S-CPICH          | S-CPICH_Ec/lor = -10 dB  | When S-CPICH is the phase reference in a test condition, the phase of S-CPICH shall be 180 degrees offset from the phase of P-CPICH. When S-CPICH is not the phase reference, it is not transmitted. |
| P-CCPCH          | P-CCPCH_Ec/lor = -12 dB  |  |
| SCH              | SCH_Ec/lor = -12 dB  | This power shall be divided equally between Primary and Secondary Synchronous channels   |
| PICH             | PICH_Ec/lor = -15 dB   |  |
| DPCH             | Test dependent power   | When S-CPICH is the phase reference in a test condition, the phase of DPCH shall be 180 degrees offset from the phase of P-CPICH.  |
| OCNS             | Necessary power so that total transmit power spectral density of Node B (Ior) adds to one <sup>1</sup> | OCNS interference consists of 16 dedicated data channels as specified in table C.6.  |

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

## C.3.3 Connection with open-loop transmit diversity mode

Table C.4 is applicable for measurements for subclause 8.6.1 (Demodulation of DCH in open loop transmit diversity mode).

Table C.4: Downlink Physical Channels transmitted during a connection<sup>1</sup>

| Physical Channel Power ratio |  | NOTE   |  |
|------------------------------|--|--|--|
| P-CPICH (antenna 1)          | P-CPICH_Ec1/lor = -13 dB   | 1. Total P-CPICH_Ec/lor = -10 dB   |  |
| P-CPICH (antenna 2)          | P-CPICH_Ec2/lor = -13 dB   |  |  |
| P-CCPCH (antenna 1)          | P-CCPCH_Ec1/lor = -15 dB   | STTD applied   |  |
| P-CCPCH (antenna 2)          | P-CCPCH_Ec2/lor = -15 dB   | 2. Total P-CCPCH_Ec/lor = -12 dB   |  |
| SCH (antenna 1 / 2)          | SCH_Ec/lor = -12 dB  | TSTD applied.     This power shall be divided equally between Primary and Secondary Synchronous channels   |  |
| PICH (antenna 1)             | PICH_Ec1/lor = -18 dB  | STTD applied   |  |
| PICH (antenna 2)             | PICH_Ec2/lor = -18 dB  | 2. Total PICH_Ec/lor = -15 dB  |  |
| DPCH                         | Test dependent power   | STTD applied     Total power from both antennas  |  |
| OCNS                         | Necessary power so that total transmit power spectral density of Node B (lor) adds to one <sup>1</sup> | 1.This power shall be divided equally between antennas     2.OCNS interference consists of 16 dedicated data channels as specified in Table C.6. |  |

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

### C.3.4 Connection with closed loop transmit diversity mode

Table C.5 is applicable for measurements for subclause 8.6.2 (Demodulation of DCH in closed loop transmit diversity mode).

Table C.5: Downlink Physical Channels transmitted during a connection<sup>1</sup>

| Physical Channel    | Power ratio  | NOTE   |  |
|---------------------|--|--|--|
| P-CPICH (antenna 1) | P-CPICH_Ec1/lor = -13 dB   | 1. Total P-CPICH Ec/lor = -10 dB   |  |
| P-CPICH (antenna 2) | P-CPICH_Ec2/lor = -13 dB   | 1. Total P-CPICH_EC/IOI = -10 dB   |  |
| P-CCPCH (antenna 1) | P-CCPCH_Ec1/lor = -15 dB   | STTD applied   |  |
| P-CCPCH (antenna 2) | P-CCPCH_Ec2/lor = -15 dB   | <ol> <li>STTD applied,</li> <li>total P-CCPCH_Ec/lor = -12 dB</li> </ol>   |  |
| SCH (antenna 1 / 2) | SCH_Ec/lor = -12 dB  | TSTD applied   |  |
| PICH (antenna 1)    | PICH_Ec1/lor = -18 dB  | STTD applied   |  |
| PICH (antenna 2)    | PICH_Ec2/lor = -18 dB  | 2. STTD applied, total PICH_Ec/lor = -15 dB  |  |
| DPCH                | Test dependent power   | Total power from both antennas   |  |
| OCNS                | Necessary power so that total transmit power spectral density of Node B (Ior) adds to one <sup>1</sup> | 1.This power shall be divided equally between antennas     2. OCNS interference consists of 16 dedicated data channels. as specified in Table C.6. |  |

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

Table C.6: DPCH Channelization Code and relative level settings for OCNS signal

| Channelization Code at SF=128 | Relative Level<br>setting (dB)<br>(Note 1) | DPCH Data       |
|-------------------------------|--|-----------------|
| 2                             | -1   | The DPCH data   |
| 11                            | -3   | for each        |
| 17                            | -3   | channelization  |
| 23                            | -5   | code shall be   |
| 31                            | -2   | uncorrelated    |
| 38                            | -4   | with each other |
| 47                            | -8   | and with any    |
| 55                            | -7   | wanted signal   |
| 62                            | -4   | over the period |
| 69                            | -6   | of any          |
| 78                            | -5   | measurement.    |
| 85                            | -9   |                 |
| 94                            | -10  |                 |
| 125                           | -8   |                 |
| 113                           | -6   |                 |
| 119                           | 0  |                 |

NOTE 1 The relative level setting specified in dB refers only to the relationship between the OCNS channels. The level of the OCNS channels relative to the Ior of the complete signal is a function of the power of the other channels in the signal with the intention that the power of the group of OCNS channels is used to make the total signal add up to 1.

NOTE: The DPCH Channelization Codes and relative level settings are chosen to simulate a signal with realistic Peak to Average Ratio.

# C.3.5 Connection with tests having DPCCH as a phase reference

Table C.6A is applicable for measurements for tests 21, 22, 23, 24 and 25 in subclause 8.3.1.

Table C.6A: Downlink Physical Channels transmitted during a connection

| Physical<br>Channel | Antenna<br>(gain) | Power   | NOTE   |
|---------------------|-------------------|---|--|
| P-CPICH             |                   | P-CPICH_Ec/lor = -10 dB   | UE is informed by higher layer signalling that P-CPICH shall not be used as a phase reference  |
| P-CCPCH             | Sector (0 dB)     | P-CCPCH_Ec/lor = -12 dB   |  |
| SCH                 | Sector (0 db)     | SCH_Ec/lor = -12 dB   | This power shall be divided equally between Primary and Secondary Synchronous channels   |
| PICH                |                   | PICH_Ec/lor = -15 dB  |  |
| DPCH                |                   | Test dependent power  | DPCH phase shall be uncorrelated with the phase of P-CPICH (different propagation in sector and beam)  |
| OCNS                | Beam (6.0dB)      | Necessary power so that<br>Beam total transmit power<br>is 20 % of Node B total<br>transmit power | <ol> <li>OCNS interference consists of<br/>16 dedicated data channels as<br/>specified in Table C.6.</li> <li>60% of the power from Node B<br/>(lor) is not involved in the<br/>tests, but is still counted as a<br/>part of the transmitted power.</li> </ol> |

# C.4 W-CDMA Modulated Interferer

Table C.7 describes the downlink Channels that are transmitted as part of the W-CDMA modulated interferer.

Table C.7: Spreading Code, Timing offsets and relative level settings for W-CDMA Modulated Interferer signal channels

| Channel<br>Type | Spreading<br>Factor | Channelization Code | Timing offset (x256T <sub>chip</sub> )   | Power   | NOTE  |
|-----------------|---------------------|---------------------|--|---|---|
| P-CCPCH         | 256                 | 1                   | 0  | P-CCPCH_Ec/lor =<br>-10 dB  |   |
| SCH             | 256                 | -                   | 0  | SCH_Ec/lor = -10<br>dB  | The SCH power shall be divided equally between Primary and Secondary Synchronous channels |
| P-CPICH         | 256                 | 0                   | 0  | P-CPICH_Ec/lor =<br>-10 dB  |   |
| PICH            | 256                 | 16                  | 16   | PICH_Ec/lor = -15<br>dB   |   |
| OCNS            | See table C.6       |                     | Necessary power<br>so that total<br>transmit power<br>spectral density of<br>Node B (Ior) adds<br>to one | OCNS interference consists of the dedicated data channels. as specified in Table C.6. |   |

# C.5 HSDPA DL Physical channels

# C.5.1 Downlink Physical Channels connection set-up

Table C.8 is applicable for the measurements for tests in subclause 9.2.1 and 9.3. Table C.9 is applicable for the measurements for tests in subclause 9.2.2. Table C.10 is applicable for the measurements for tests in subclause 9.2.3. Table C.11 is applicable for the measurements for tests in subclause 9.4.

Table C.8: Downlink physical channels for HSDPA receiver testing for Single Link performance.

| Physical<br>Channel | Parameter       | Value   | Note  |
|---------------------|-----------------|---|---|
| P-CPICH             | P-CPICH_Ec/lor  | -10dB   |   |
| P-CCPCH             | P-CCPCH_Ec/lor  | -12dB   | Mean power level is shared with SCH.  |
| SCH                 | SCH_Ec/lor      | -12dB   | Mean power level is shared with P-CCPCH – SCH includes P- and S-SCH, with power split between both. P-SCH code is S_dl,0 as per TS25.213 S-SCH pattern is scrambling code group 0 |
| PICH                | PICH_Ec/lor     | -15dB   |   |
| DPCH                | DPCH_Ec/lor     | Test-specific   | 12.2 kbps DL reference measurement channel as defined in Annex A.3.1  |
| HS-SCCH_1           | HS-SCCH_Ec/lor  | Test-specific   | Specifies fraction of Node-B radiated power transmitted when TTI is active (i.e. due to minimum inter-TTI interval).  |
| HS-SCCH_2           | HS-SCCH_Ec/lor  | DTX"d   | No signalling scheduled, or power radiated, on this HS-SCCH, but signalled to the UE as present.  |
| HS-SCCH_3           | HS-SCCH_Ec/lor  | DTX"d   | As HS-SCCH_2.   |
| HS-SCCH_4           | HS-SCCH_Ec/lor  | DTX"d   | As HS-SCCH_2.   |
| HS-PDSCH            | HS-PDSCH_Ec/lor | Test-specific   |   |
| OCNS                |                 | Necessary power so that total transmit power spectral density of Node B (lor) adds to one | OCNS interference consists of 6 dedicated data channels as specified in table C.12.   |

Table C.9: Downlink physical channels for HSDPA receiver testing for Open Loop Transmit Diversity performance.

| Physical Channel    | Parameter       | Value  | Note  |
|---------------------|-----------------|--|---|
| P-CPICH (antenna 1) | P-CPICH_Ec1/lor | -13dB  | 1. Total P-CPICH_Ec/lor = -10dB   |
| P-CPICH (antenna 2) | P-CPICH_Ec2/lor | -13dB  |   |
| P-CCPCH (antenna 1) | P-CCPCH_Ec1/lor | -15dB  | 1. STTD applied. 2. Total P-CCPCH Ec/lor is –12dB.  |
| P-CCPCH (antenna 2) | P-CCPCH_Ec2/lor | -15dB  | 2. Total P-CCPCH Ec/lor IS = 12dB.  |
| SCH (antenna 1/2)   | SCH_Ec/lor      | -12dB  | TSTD applied.     Power divided equally between primary and secondary SCH.  |
| PICH (antenna 1)    | PICH_Ec1/lor    | -18dB  | 1. STTD applied.  |
| PICH (antenna 2)    | PICH_Ec2/lor    | -18dB  | 2. Total PICH Ec/lor is –15dB.  |
| DPCH                | DPCH_Ec/lor     | Test-specific  | 1. STTD applied.  |
| HS-SCCH_1           | HS-SCCH_Ec/lor  | Test-specific  | STTD applied.     Specifies fraction of Node-B radiated power transmitted when TTI is active (i.e. due to minimum inter-TTI interval).                |
| HS-SCCH_2           | HS-SCCH_Ec/lor  | DTX"d  | UE assumes STTD applied.     No signalling scheduled, or power radiated, on this HS-SCCH, but signalled to the UE as present.                         |
| HS-SCCH_3           | HS-SCCH_Ec/lor  | DTX"d  | 1. As HS-SCCH_2.  |
| HS-SCCH_4           | HS-SCCH_Ec/lor  | DTX"d  | 2. As HS-SCCH_2.  |
| HS-PDSCH            | HS-PDSCH_Ec/lor | Test-specific  | 1. STTD applied.  |
| OCNS                |                 | Necessary  | 1. STTD applied.  |
|                     |                 | power so   | 2. Balance of power $I_{or}$ of the Node-B is   |
|                     |                 | that total transmit power spectral density of Node B (lor) adds to one | assigned to OCNS.  3. Power divided equally between antennas.  4. OCNS interference consists of 6 dedicated data channels as specified in table C.12. |

Table C.10: Downlink physical channels for HSDPA receiver testing for Closed Loop. Transmit Diversity (Mode-1) performance.

| Physical Channel    | Parameter       | Value  | Note  |
|---------------------|-----------------|--|---|
| P-CPICH (antenna 1) | P-CPICH_Ec1/lor | -13dB  | 1. Total P-CPICH_Ec/lor = -10dB   |
| P-CPICH (antenna 2) | P-CPICH_Ec2/lor | -13dB  |   |
| P-CCPCH (antenna 1) | P-CCPCH_Ec1/lor | -15dB  | 1. STTD applied. 2. Total P-CCPCH Ec/lor is –12dB.  |
| P-CCPCH (antenna 2) | P-CCPCH_Ec2/lor | -15dB  | 2. Total P-CCPCH EC/101 IS -120B.   |
| SCH (antenna 1/2)   | SCH_Ec/lor      | -12dB  | TSTD applied.     Power divided equally between primary and secondary SCH.  |
| PICH (antenna 1)    | PICH_Ec1/lor    | -18dB  | 1. STTD applied.  |
| PICH (antenna 2)    | PICH_Ec2/lor    | -18dB  | 2. Total PICH Ec/lor is –15dB.  |
| DPCH                | DPCH_Ec/lor     | Test-specific  | 1. CL1 applied.   |
| HS-SCCH_1           | HS-SCCH_Ec/lor  | Test-specific  | STTD applied.     Specifies fraction of Node-B radiated power transmitted when TTI is active (i.e. due to minimum inter-TTI interval).                |
| HS-SCCH_2           | HS-SCCH_Ec/lor  | DTX"d  | UE assumes STTD applied.     No signalling scheduled, or power radiated, on this HS-SCCH, but signalled to the UE as present.                         |
| HS-SCCH_3           | HS-SCCH_Ec/lor  | DTX"d  | 1. As HS-SCCH_2.  |
| HS-SCCH_4           | HS-SCCH_Ec/lor  | DTX"d  | 2. As HS-SCCH_2.  |
| HS-PDSCH            | HS-PDSCH_Ec/lor | Test-specific  | 1. CL1 applied.   |
| OCNS                |                 | Necessary  | 1. STTD applied.  |
|                     |                 | power so   | 2. Balance of power $I_{or}$ of the Node-B is   |
|                     |                 | that total<br>transmit<br>power<br>spectral<br>density of<br>Node B (lor)<br>adds to one | assigned to OCNS.  3. Power divided equally between antennas.  4. OCNS interference consists of 6 dedicated data channels as specified in table C.12. |

Table C.11: Downlink physical channels for HSDPA receiver testing for HS-SCCH detection performance

| Parameter              | Units | Value  | Comment   |
|------------------------|-------|--|---|
| CPICH $E_c/I_{or}$     | dB    | -10  |   |
| P-CCPCH $E_c/I_{or}$   | dB    | -12  | Mean power level is shared with SCH.  |
| SCH $E_c/I_{or}$       | dB    | -12  | Mean power level is shared with P-CCPCH – SCH includes P- and S-SCH, with power split between both. P-SCH code is S_dl,0 as per TS25.213 S-SCH pattern is scrambling code group 0 |
| PICH $E_c/I_{or}$      | dB    | -15  |   |
| HS-DSCH-1 $E_c/I_{or}$ | dB    | -10  | HS-DSCH associated with HS-SCCH-1. The HS-DSCH shall be transmitted continuously with constant power.   |
| HS-DSCH-2 $E_c/I_{or}$ | dB    | DTX  | HS-DSCH associated with HS-SCCH-2   |
| HS-DSCH-3 $E_c/I_{or}$ | dB    | DTX  | HS-DSCH associated with HS-SCCH-3   |
| HS-DSCH-4 $E_c/I_{or}$ | dB    | DTX  | HS-DSCH associated with HS-SCCH-4   |
| $DPCH\ E_c/I_{or}$     | dB    | -8   | 12.2 kbps DL reference measurement channel as defined in Annex A.3.1  |
| HS-SCCH-1 $E_c/I_{or}$ | dB    | Test Specific  | All HS-SCCH"s allocated equal $E_c/I_{or}.$   |
| HS-SCCH-2 $E_c/I_{or}$ | dB    |  | Specifies $E_{c}/I_{or}$ when TTI is active.  |
| HS-SCCH-3 $E_c/I_{or}$ | dB    |  |   |
| HS-SCCH-4 $E_c/I_{or}$ | dB    |  |   |
| OCNS $E_c/I_{or}$      | dB    | Necessary power so that<br>total transmit power<br>spectral density of Node B<br>(lor) adds to one | OCNS interference consists of 6 dedicated data channels as specified in table C.12.   |

### C.5.2 OCNS Definition

The selected channelization codes and relative power levels for OCNS transmission during for HSDPA performance assessment are defined in Table C.12. The selected codes are designed to have a single length-16 parent code.

Table C.12: OCNS definition for HSDPA receiver testing.

| Channelization<br>Code at SF=128 | Relative Level<br>setting (dB)<br>(Note 1) | DPCH Data                        |
|----------------------------------|--|----------------------------------|
| 122                              | 0  | The DPCH data for each           |
| 123                              | -2   | channelization code shall be     |
| 124                              | -2   | uncorrelated with each other and |
| 125                              | -4   | with any wanted signal over the  |
| 126                              | -1   | period of any measurement.       |
| 127                              | -3   |                                  |

NOTE 1: The relative level setting specified in dB refers only to the relationship between the OCNS channels. The level of the OCNS channels relative to the Ior of the complete signal is a function of the power of the other channels in the signal with the intention that the power of the group of OCNS channels is used to make the total signal add up to 1.

# Annex D (normative): Environmental conditions

### D.1 General

This normative annex specifies the environmental requirements of the UE. Within these limits the requirements of the present documents shall be fulfilled.

# D.2 Environmental requirements

The requirements in this clause apply to all types of UE(s).

### D.2.1 Temperature

The UE shall fulfil all the requirements in the full temperature range of:

Table D.1

| +15°C to +35°C | for normal conditions (with relative humidity of 25 % to 75 %)  |
|----------------|---|
| -10°C to +55°C | for extreme conditions (see IEC publications 68-2-1 and 68-2-2) |

Outside this temperature range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation.

# D.2.2 Voltage

The UE shall fulfil all the requirements in the full voltage range, i.e. the voltage range between the extreme voltages.

The manufacturer shall declare the lower and higher extreme voltages and the approximate shutdown voltage. For the equipment that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified below.

Table D.2

| Power source                | Lower extreme  | Higher extreme | Normal conditions |
|-----------------------------|----------------|----------------|-------------------|
|                             | voltage        | voltage        | voltage           |
| AC mains                    | 0,9 * nominal  | 1,1 * nominal  | nominal           |
| Regulated lead acid battery | 0,9 * nominal  | 1,3 * nominal  | 1,1 * nominal     |
| Non regulated batteries:    |                |                |                   |
| Leclanché / lithium         | 0,85 * nominal | Nominal        | Nominal           |
| Mercury/nickel & cadmium    | 0,90 * nominal | Nominal        | Nominal           |

Outside this voltage range the UE if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation. In particular, the UE shall inhibit all RF transmissions when the power supply voltage is below the manufacturer declared shutdown voltage.

### D.2.3 Vibration

The UE shall fulfil all the requirements when vibrated at the following frequency/amplitudes.

Table D.3

| Frequency       | ASD (Acceleration Spectral Density) random vibration                  |
|-----------------|---|
| 5 Hz to 20 Hz   | $0.96 \text{ m}^2/\text{s}^3$   |
| 20 Hz to 500 Hz | 0,96 m <sup>2</sup> /s <sup>3</sup> at 20 Hz, thereafter –3 dB/Octave |

Outside the specified frequency range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation

# Annex E (informative): Change history
