# ETSI TS 126 104 V5.1.0 (2003-03)

Technical Specification

Digital cellular telecommunications system (Phase 2+); Universal Mobile Telecommunications System (UMTS); ANSI-C code for the floating-point Adaptive Multi-Rate (AMR) speech codec (3GPP TS 26.104 version 5.1.0 Release 5)

Reference
RTS/TSGS-0426104v510

Keywords
GSM, UMTS

## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

All published ETSI deliverables shall include information which directs the reader to the above source of information.

#### **Foreword**

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <a href="http://webapp.etsi.org/key/queryform.asp">http://webapp.etsi.org/key/queryform.asp</a> .

#### **Foreword**

This Technical Specification (TS) has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

#### where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

## 1 Scope

This Technical Standard (TS) contains an electronic copy of the ANSI-C code for a floating-point implementation of the Adaptive Multi-Rate codec. This floating-point codec specification is mainly targeted to be used in multimedia applications such as the 3G-324M terminal specified in 3GPP TS 26.110, or in packet-based (e.g., H.323) applications. The bit-exact fixed-point ANSI-C code in 3GPP TS 26.073 remains the preferred implementation for all applications, but the floating-point codec may be used instead of the fixed-point codec when the implementation platform is better suited for a floating-point implementation. It has been verified that the fixed-point and floating-point codecs interoperate with each other without any artifacts.

The floating-point ANSI-C code in this specification is the only standard conforming non-bit-exact implementation of the Adaptive Multi Rate speech transcoder (3GPP TS 26.090 [2]), Voice Activity Detection (3GPP TS 26.094 [6]), comfort noise generation (3GPP TS 26.092 [4]), and source controlled rate operation (3GPP TS 26.093 [5]). The floating-point code also contains example solutions for substituting and muting of lost frames (3GPP TS 26.091 [3]).

The fixed-point specification in 26.073 shall remain the only allowed implementation for the 3G mandatory speech service and the use of the floating-point codec is strictly limited to other services.

The floating-point encoder in this specification is a non-bit-exact implementation of the fixed-point encoder producing quality indistinguishable from that of the the fixed-point encoder. The decoder in this specification is functionally a bit-exact implementation of the fixed-point decoder, but the code has been optimized for speed and the standard fixed-point libraries are not used as such.

#### 2 Normative references

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.
- 3GPP TS 26.074: "AMR Speech Codec; Test sequences". [1] [2] 3GPP TS 26.090: "AMR Speech Codec; Speech transcoding". 3GPP TS 26.091: "AMR Speech Codec; Substitution and muting of lost frames". [3] [4] 3GPP TS 26.092: "AMR Speech Codec; Comfort noise aspects". 3GPP TS 26.093: "AMR Speech Codec; Source controlled rate operation". [5] [6] 3GPP TS 26.094: "AMR Speech Codec; Voice Activity Detection". [7] 3GPP TS 26.073: "ANSI-C code for the Adaptive Multi Rate speech codec". 3GPP TS 26.101: "AMR Speech Codec Frame Structure". #### 3 Definitions and abbreviations

#### 3.1 Definitions

Definition of terms used in the present document, can be found in 3GPP TS 26.090 [2], 3GPP TS 26.091 [3], 3GPP TS 26.092 [4], 3GPP TS 26.093 [5], and 3GPP TS 26.094 [6].

#### 3.2 Abbreviations

For the purpose of the present document, the following abbreviations apply:

ANSI American National Standards Institute
ETS European Telecommunication Standard
GSM Global System for Mobile communications

I/O Input/Output

RAM Random Access Memory ROM Read Only Memory

## 4 C code structure

This clause gives an overview of the structure of the floating-point C code and provides an overview of the contents and organization of the C code attached to this document. The basic structure of the floating-point C code follows that of the bit-exact fixed-point code [7].

The C code has been verified on the following systems:

- IBM PC/AT compatible computers with Windows NT40 and Microsoft Visual C++ v.5.0 compiler;
- HP workstations and GNU gcc compiler;
- IBM PC/AT compatible computers with Linux operating system and GNU gcc compiler;

ANSI-C 9899 was selected as the programming language because portability was desirable

#### 4.1 Contents of the C source code

The C code distribution has all files in the root level.

The files with suffix "c" contain the source code and the files with suffix "h" are the header files. The ROM data is contained in "rom" files with suffix "h".

The C code does not contain any speech coder installation verification data files. Verification for the bit-exact decoder is defined in specification 3GPP TS 26.073 [7].

Makefiles are provided for the platforms in which the C code has been verified (listed above). Once the software is installed, this directory will have a compiled version of encoder and decoder and all the object files.

#### 4.2 Program execution

The Adaptive Multi-Rate codec is implemented in two programs:

- (encoder) speech encoder;
- (decoder) speech decoder.

The programs should be called like:

encoder [-dtx] mode speech\_file bitstream\_file

or

encoder [-dtx] -modefile=mode\_file speech\_file bitstream\_file

decoder <parameter file> <speech output file>

The speech files contain 16-bit linear encoded PCM speech samples and the parameter files contain encoded speech data and some additional flags.

See the file readme.txt for more information on how to run the *encoder* and *decoder* programs.

## 4.3 Coding style

The C code has been written according to structuring conventions used in 3GPP TS 26.073 [7]. Encoder and decoder state structures are allocated and initialized with special initializing functions. There are no separate functions for each module, as opposed to the fixed-point implementation in 3GPP TS 26.073 [7].

### 4.4 Code hierarchy

The code hierarchy follows the one specified in 3GPP TS 26.073 [7].

Figures 1 to 4 are call graphs that show the functions used in the speech codec, including the functions of VAD, DTX, and comfort noise generation.

Each column represents a call level and each cell a function. The functions contain calls to the functions in rightwards neighboring cells. The time order in the call graphs is from the top downwards as the processing of a frame advances. All standard C functions, such as printf(), fwrite(), etc., have been omitted.

The encoder call graph is broken down into three separate call graphs, shown in Tables 1 to 3.

## 4.5 Variables, constants and tables

The data types of variables and tables used in the floating-point implementation are signed integers in 2's complement representation, defined by:

Word8 8 bit variable

UWord8 8 bit unsigned variable

Word16 16 bit variable Word32 32 bit variable

Floating-point numbers use the IEEE (Institute of Electrical and Electronics Engineers) format:

Float32 8 bit exponent, 23 bit mantissa, 1 bit sign

Float64 11 bit exponent, 52 bit mantissa, 1 bit sign

Furthermore some **enum** types are used, all possible to represent with one byte, and a boolean **Flag**.

#### 4.5.1 Description of constants used in the C code

Constants for the codec are defined in rom (h) files.

### 4.5.2 Description of fixed tables used in the C code

This section contains a listing of all fixed tables sorted by source file name and table name.

Table 5: Speech encoder fixed tables

File	Table name	Type[Length]	Description
rom_enc.h	trackTable	Word8[4*5]	track table for algebraic code book search (MR475, MR515)
rom_enc.h	gamma1	Float32[10]	spectral expansion factors
rom_enc.h	gamma1_12k2	Float32[10]	spectral expansion factors
rom_enc.h	gamma2	Float32[10]	spectral expansion factors
rom_enc.h	b60	Float32]61]	interpolation filter coefficients
rom_enc.h	startPos1	Word16[2]	track start search position for first pulse
rom_enc.h	startPos2	Word16[4]	track start search position for second pulse
rom_enc.h	startPos	Word16[16]	track start search position
rom_enc.h	corrweight	Float32[251]	weighting of the correlation function in open loop LTP search (MR102)
rom_enc.h	qua_gain_pitch	Float32[16]	adaptive codebook gain quantization table (MR795)
rom_enc.h	qua_gain_pitch_MR12	Float32[16]	adaptive codebook gain quantization table (MR122)
	2		
rom_enc.h	qua_gain_code	Float32[64]	fixed codebook gain quantization table (MR122, MR795)
rom_enc.h	gray	Word8[8]	gray coding table
rom_enc.h	grid	Float32[61]	grid points at wich Chebyshev polynomials are evaluated
rom_enc.h	b24	Float32[25]	interpolation filter coefficients
rom_enc.h	lag_wind	Float32[10]	lag window table
rom_enc.h	lsp_init_data	Float32[10]	initialization table for lsp history in DTX
rom_enc.h	past_rq_init	Float32[80]	initialization table for the MA predictor in DTX
rom_enc.h	mean_lsf_3	Float32[10]	LSF means (not in MR122)

#### 4.5.3 Static variables used in the C code

In this section, two tables that specify the static variables for the speech encoder and decoder, respectively, are shown. All static variables are declared within a C **struct.** 

Table 7: Speech encoder static variables

Speech Encode	Struct name	Variable	Type[Length]	Description
pre_state dtx	Speech_Encode_	cod_amr_state	cod_amrState	see below in this table
Pre_ProcessState   y2	FrameState			
Pre_ProcessState   y2		pre_state	Pre_ProcessState	see below in this table
y1 Word16 Float32 filter state  x0 Float32 filter state  x1 Float32 filter state  x2 Float32 filter state  x3 Float32 filter state  x4 Float32 filter state  x5 Float32 filter state  x6 Float32 filter state  x8 Float32 powinter to LPC analysis window with no lookahead in old_speech upointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to the LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to the LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to the current frame in old_speech pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to the current frame in old_speech pointer to the current excitate in old_speech (MR122)  x8 Float32 pointer to the current frame in old_speech pointer to the current excitate in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32 pointer to LPC analysis window with no lookahead in old_speech (MR122)  x8 Float32		dtx	Word32	Is set if DTX functionality is used

complex_hang_count Word16 complex hangover counter, used by VAD		•		
complex_hang_timer Word16 hangover initiator, used by CAD				

Struct name	Variable	Type[Length]	Description
	best_corr_hp	Float32	filtered value
	speech_vad_decision	Word16	final decision
	complex_warning	Word16	complex background warning
	sp_burst_count	Word16	counts length of a speech burst incl HO addition
	corr_hp_fast	Word16	filtered value
dtx_encState	lsp_hist	Float32[80]	LSP history (8 frames)
	log_en_hist	Float32 [8]	logarithmic frame energy history (8 frames)
	hist_ptr	Word16	pointer to the cyclic history vectors
	log_en_index	Word16	Index for logarithmic energy
	init_lsf_vq_index	Word32	initial index for lsf predictor
	lsp_index	Word16[3]	Isp indecies to the three code books
	dtxHangoverCount	Word16	is decreased in DTX hangover period
	decAnaElapsedCount	Word16	counter for elapsed speech frames in DTX
lpcState	LevinsonSt	LevinsonState	see below
LevinsonState	old_A	Float32[11]	last frames direct form coefficients
IspState	lsp_old	Float32 [10]	old LSP vector
'	lsp_old_q	Float32 [10]	old quantized LSP vector
	qSt	Q_plsfState	see below in this table
Q_plsfState	past_rq	Float32[10]	past quantized LSF prediction error
clLtpState	pitchSt	Pitch_frState	see below in this table
tonStabState	count	Word16	count consecutive (potential) resonance frames
	gp	Float32[7]	pitch gain history
Pitch_frState	T0_prev_subframe	Word32	integer. pitch lag of previous subframe
gainQuantState	sf0_ gcode0	Float32	subframe 0/2 codebook gain
	sf0_ target_en	Float32	subframe 0/2 target energy
	sf0_ coeff	Float32 [5]	subframe 0/2 energy coefficient
	gain_idx_ptr	Word16*	pointer to gain index value in parameter frame
	gc_predSt	gc_predState	see below in this table
	gc_predUncSt	gc_predState	see below in this table
	adaptSt	GainAdaptState	see below in this table
gc_predState	past_qua_en	Float32[4]	MA predictor memory (20*log10(pred. error))
GainAdaptState	onset	Word16	onset counter
	prev_alpha	Float32	previous adaptor output
	prev_gc	Float32	previous codebook gain
	ltpg_mem	Float32 [5]	pitch gain history
pitchOLWghtState	old_T0_med	Word32	weighted open loop pitch lag
	ada_w	Float32	weigthing level depeding on open loop pitch gain
	wght_flg	Word16	switches lag weighting on and off

	y1_lo	Word32	filter state, lower word
	x0	Word32	filter state
	x1	Word32	filter state

## 5 Homing procedure

The principles of the homing procedures are described in 3GPP TS 06.090 [2]. This specification only includes a detailed description of the 8 decoder homing frames. For each AMR codec mode, the corresponding decoder homing frame has a fixed set of speech parameters shown in table 9a-9h. The bit allocation within these parameters is identical to the corresponding bit allocation of the source encoder output parameters given in 3GPP TS 06.090 [2].

In the following tables, the following naming convention is used for the individual parameters. Letters in *italics* indicate numbers.

- LPC nindex of nth LSF submatrix
- LTP-LAG m adaptive codebook index for subframe m
- LTP-GAIN madaptive codebook gain index in subframe m
- FCB-GAIN m fixed codebook gain index in subframe m
- GAIN\_VQ m codebook gain VQ index in subframe m (subframe m and m+1 for MR475)
- POS *m\_n* position index of *n*th pulse in subframe m
- POS m\_n\_k position index of nth and kth pulse in subframe m
- POS  $m_n k_l$  position index of nth, kth, lth, and jth pulse in subframe m
- SIGN m\_n\_k sign information for nth and kth pulse in subframe m
- SIGN  $m_n_k_l$  sign information for nth, kth, lth, and jth pulse in subframe m
- SIGN\_m\_n\_k\_POS\_m\_n sign information for *n*th and *k*th pulse and position index for *n*th pulse in subframe *m*

## 6 File formats

This section describes the file formats used by the encoder and decoder programs. The test sequences defined in [2] also use the file formats described here.

## 6.1 Speech file (encoder input / decoder output)

Speech files read by the encoder and written by the decoder consist of 16-bit words where each word contains a 13-bit, left aligned speech sample. The byte order depends on the host architecture (e.g. MSByte first on SUN workstations, LSByte first on PCs etc.). Both the encoder and the decoder program process complete frames (of 160 samples) only.

This means that the encoder will only process n frames if the length of the input file is n\*160 + k words, while the files produced by the decoder will always have a length of n\*160 words.

#### 6.2 Mode control file (encoder input)

The encoder program can optionally read in a mode control file which specifies the encoding mode for each frame of speech processed. The file is a text file containing one line per speech frame. Each line contains one of the mode names from the list {MR475, MR515, MR59, MR67, MR74, MR795, MR102, MR122}.

## 6.3 Parameter bitstream file (encoder output / decoder input)

The files produced by the speech encoder/expected by the speech decoder contain an arbitrary number of frames in the format described in RFC 3267 [9], sections 5.1 and 5.3.

By using preprocessor definition encoder/decoder can optionally use AMR Interface Format 2. The format is described in TS 26.101 [8] Annex A.

By using another preprocessor definition encoder/decoder can optionally use format compatible with the existing AMR fixed-point C-code. Frame format is following.

FRAI	ME_TYPE	B1	B2		B244	MODE_INFO	unused1		unused4	
------	---------	----	----	--	------	-----------	---------	--	---------	--

Each box corresponds to one Word16 value in the bitstream file, for a total of 250 words or 500 bytes per frame. The fields have the following meaning:

```
FRAME_TYPE transmit frame type, which is one of
```

TX\_SPEECH (0x0000)

TX\_SID\_FIRST(0x0001)

TX\_SID\_UPDATE (0x0002)

TX\_NO\_DATA (0x0003)

B0...B244 speech encoder parameter bits (i.e. the bitstream itself). Each Bx either has the value 0x0000

or 0x0001. Only mode MR122 really uses all 244 bits; for the other modes, only the first n

bits are used  $(35 \le n \le 204)$ . The remaining bits are unused (written as 0x0000)

#### MODE\_INFO encoding mode information, which is one of

MR475 (0x0000)

MR515 (0x0001)

MR59 (0x0002)

MD (7 (0-0002)

MR67 (0x0003)

MR74 (0x0004) MR795 (0x0005)

MR102 (0x0006)

MR122 (0x0007)

#### unused1...4 unused, written as 0x0000

As indicated in section 6.1 above, the byte order depends on the host architecture.
