Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp .

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

The present document is part of a TS-family covering the 3rd Generation Partnership Project: Technical Specification Group Services and System Aspects; Telecommunication management; as identified below:

32.111-1	'Fault Management; Part 1: 3G fault management requirements'.
32.111-2	'Fault Management; Part 2: Alarm Integration Reference Point (IRP): Information Service (IS)'.
32.111-3	'Fault Management; Part 3: Alarm Integration Reference Point (IRP): Common Object Request 'Broker Architecture (CORBA) Solution Set (SS)'.
22 111 1	
32.111-4	'Fault Management; Part 4: Alarm Integration Reference Point (IRP): Common Management Information Protocol (CMIP) Solution Set (SS)'.

1 Scope

The present document defines the alarm integration reference point for the CMIP solution set. In detail:

- clause 4 contains an introduction to some basic concepts of the CMIP interfaces;
- clause 5 contains the GDMO definitions for the Alarm Management over the CMIP interfaces;
- clause 6 contains the ASN.1 definitions supporting the GDMO definitions provided in clause 5.

This Solution Set specification is related to 3GPP TS 32.111-2 (V6.3.X).

2 References

The following documents contain provisions, which through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

CM Configuration Management

CMIP Common Management Information Protocol
CMIS Common Management Information Service

CMISE Common Management Information Service Element

EFD Event Forwarding Discriminator

EM Element Manager

FTAM File Transfer Access and Management

GDMO Guidelines for the Definition of Managed Objects

IOC Information Object Class IRP Integration Reference Point

Itf-N Interface N (between NM and EM/NE)

ITU-T International Telecommunication Union - Telecommunications

M Mandatory

MOC Managed Object Class
MOI Managed Object Instance
NE Network Florent

NE Network Element NM Network Manager

NMC Network Management Centre

O Optional

OS Operations System

TMN Telecommunications Management Network

4 Basic aspects

The present document provides all the GDMO and ASN.1 definitions necessary to implement the Alarm IRP Information Service (3GPP TS 32.111-2 [9]) for the CMIP interface.

4.1 Architectural aspects

The Alarm IRP Information Service description is based on Information Object Classes (IOC), Relationships among IOC and Interfaces (used or implemented by IOC) which include Operations and/or Notifications.

In the present document, for the CMIP interfaces the IOC are modelled as GDMO "Managed Object Classes" (MOC) defined specifically for alarm management, the Operations are modelled as GDMO "Actions" of a MOC while the Notifications are modelled as GDMO "Notifications" included in MOCs that need to report events to the Manager. In more detail, the Notifications related to alarm management are included in a MOC defined in the present document while the Notifications defined for alarm reporting are not included in any MOC defined in the present document. They will be included in other MOCs defined in other CMIP Solution Set or in other CMIP Information Models.

Regarding the Notifications, the present document is based on the Notification IRP CMIP Solution Set (3GPP TS 32.304 [10]).

4.1.1 Reporting new alarms

In case of an alarm occurrence the Agent notifies all subscribed Managers that a new alarm has occurred and has been added into the alarm list of the Agent.

For this purpose the standardised alarm notifications defined in ITU-T Recommendations X.721 [4], X.733 [5] and X.736 [12] are used.

4.1.2 Reporting changed alarms

Although in the Alarm IRP Information Service (3GPP TS 32.111-2 [9]) there is a notification specifically defined to report the event of alarm attribute changes, on the CMIP interfaces such events are reported according to ITU-T Recommendations X.721 [4], X.733 [5] and X.736 [12], i.e. the original alarm is first cleared (by means of a clear alarm notification) and then a new alarm notification with the changed parameter values is generated by the Agent.

4.1.3 Reporting cleared alarms

On the CMIP interfaces the clearing of alarms is reported by the Agent to the Managers in accordance with the mechanisms defined in ITU-T Recommendation X.733 [5], X.736 [12] and ITU-T Recommendation Q.821 [7].

4.1.4 Acknowledgment of alarms

This clause relates to the co-operative alarm acknowledgment managed on Itf-N, which implies that the acknowledgment of alarms can be done on both NM and EM.

The acknowledgment of alarms is managed by means of the MOC alarmControl, which includes:

- one action to acknowledge alarms (acknowledgeAlarms);
- one action to unacknowledge alarms (unacknowledgeAlarms);
- ITU-T Recommendation X.721 [4] compliant alarm notifications to inform Managers about changes of acknowledgment state.

In case an alarm is acknowledged by an operator or automatically by a management system, the <code>ackUserId</code>, <code>ackSystemId</code>, <code>ackState</code> and <code>ackTime</code> information is stored in the additionalInformation field of the alarm present in the alarm list.

4.1.5 Management of comments associated to alarms

This feature provides the NM and EM operators with the capability to add comments to an alarm and to share such information among all the OS (EM and NM) that are involved in the network management. This implies that a synchronisation of the comments between the EM and NM shall be possible. An OS shall have the capability to record more than one comment for each alarm.

The management of the comments associated to alarms is similar to the management of the acknowledgment of alarms and is achieved by means of the same MOC alarmControl. For the management of the comments, the MOC alarmControl includes

- one action (setComment) allowing the NM operator to add a comment to one or several alarms;
- ITU-T Recommendation X.721 [4] compliant alarm notifications to inform the IRPManagers about changes of alarm related comments. Such notifications are generated by the Agent towards all connected Managers either if the comment is made by an NM operator (i.e. after the completion of a previous *setComment* request) or if the comment is made by an EM operator.

4.1.6 Alignment of alarm conditions over the Itf-N

The IRP Manager is able to trigger the alarm conditions alignment using the Action getAlarmList

The following specifies the logical steps of the alignment procedure, by describing a possible implementation. Any other implementation showing the same behaviour on the Itf-N interface is compliant with the present document.

- The Manager sends to the Agent a getAlarmList request containing the following information:
 - *alarmAckState*, used to select the alarms from the Agent's alarm list for the current alignment (e.g. all active alarms).
 - baseObjectClass, baseObjectInstance, identifies the part of the alarm list to be uploaded.
 - destination, identifying the destination to which event reports that have passed the filter conditions are sent.
 - *filter*, this optional parameter defines the conditions an alarm notification shall fulfil in order to be forwarded to the Manager. It applies only for the current alignment request.
- After evaluation of the request, the Agent first generates an *alignmentId* value, which unambiguously identifies this alignment process. This value is used by the Manager to correlate alarm reports to the corresponding alignment requests, in case this Manager issues several alarm alignments in parallel.
- The Agent creates a temporary Event Forwarding Discriminator (EFD) instance for the purpose of this alarm alignment, using the parameters *destination* and *filter* received in the request. If the *filter* parameter is absent in the alarm synchronisation request, all alarm notifications are forwarded to the Manager through this EFD, taking into account both the *filter* constraint currently active for the event reporting to the manager having invoked the synchronisation request and the value of the parameter *alarmAckState*.

 The filter is set by the Agent automatically in order to forward only those alarm notifications containing, at the beginning of the field *additionalText*, the string "(ALIGNMENT-<alignmentId>)". The filter must also forward the notification *notifyAlarmAlignmentEnd* indicating the end of the alarm alignment process. The alarm alignment end notifications of other alignment processes shall be filtered out using the *alignmentId* carried by the event information parameter of *notifyAlarmAlignmentEnd*.
- The Agent sends back a *getAlarmList* response, which contains the *alignmentId* described above and the *status* information, indicating the result of the request. (see the message flow in Figure 1).
- The Agent scans now its alarm list. For every alarm, which matches the criteria defined by the *alarmAckState* parameter and the *filter* parameter, the Agent inserts, at the beginning of the field *additionalText*, the string "(ALIGNMENT-<alignmentId>)". According to ITU-T Recommendation X.734 [6], the Agent forwards these alarm notifications towards all EFDs.

NOTE: These alarm notifications can reach the current Manager only via the temporary EFD created for the current alignment. They are filtered out:

- a) By all the EFD instances used for "real-time" alarm reporting, due to the presence of the sub-string "ALIGNMENT" in the field *additionalText* (see 3GPP TS 32.304 [10]).
- b) By all temporary EFD instances possibly created for parallel alignments, due to the presence of the unambiguous sub-string "<alignmentId>" in the additionalText field.
- At the end of the alarm alignment process the Agent shall send the dedicated notification notifyAlarmAlignmentEnd in order to indicate the end of the current alignment process (unambiguously identified by the alignmentId). In case the alarm list is empty or no alarm matches the criteria defined by the alarmAckState parameter and the filter parameter the notification notifyAlarmAlignmentEnd shall be emitted directly after the agent has send the getAlarmList response.
- The temporary EFD of the current alarm alignment process shall forward only alarm alignment end notifications carrying in the event information field the *alignmentId* of this alignment process. All other alarm alignment end notifications shall be filtered out.
- After sending the notification *notifyAlarmAlignmentEnd* the Agent automatically deletes the temporary EFD instance (see figure 1).

At the end of the alarm conditions alignment the acknowledgement state and the comments assigned to each alarm are implicitly synchronised between the IRPAgent and the IRPManager that has requested the alignment.

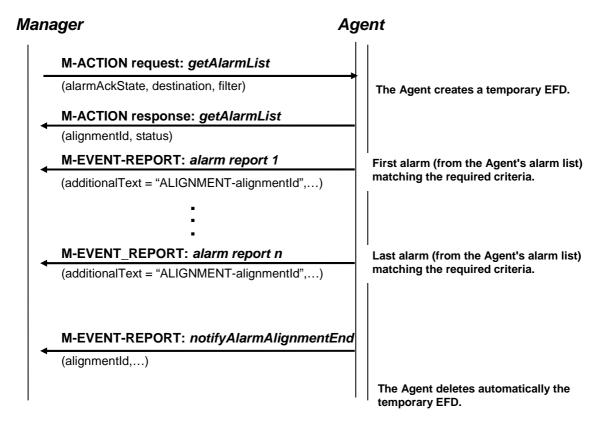

Figure 1: Alignment arrow diagram

Figure 2 shows the handling of a "real-time" alarm notification (occurred during the execution of the *getAlarmList* operation), which is forwarded by the Agent (according to ITU-T Recommendation X.734 [6]) to all currently available EFD instances. Dependent on the *discriminatorConstruct* setting of every EFD, such an alarm may or may not reach the related Manager. In any case, this alarm is filtered out by the temporary EFD assigned to the Manager, which triggered the *getAlarmList* request.

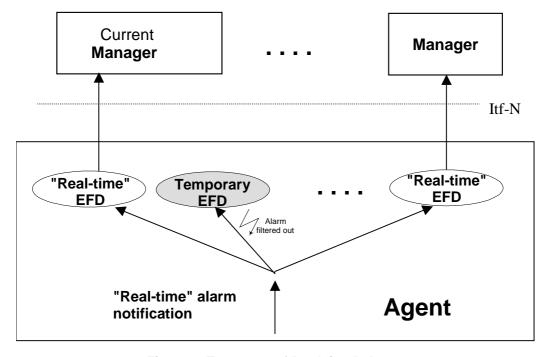

Figure 2: Treatment of "real time" alarms

Figure 3 shows the handling of an alarm notification from the alarm list, matching the criteria defined in the parameters *alarmAckState* of the *getAlarmList* request and forwarded by the Agent to all EFD instances as well. This alarm is filtered out by all EFD instances in charge of discrimination of "real-time" alarms and can reach only the Manager, which triggered the *getAlarmList* request, because it passes the temporary EFD instance assigned to this Manager.

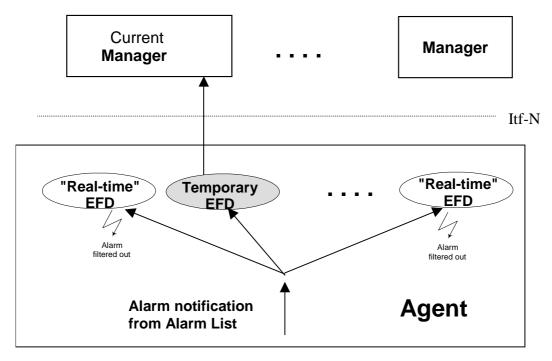

Figure 3: Treatment of "alignment" alarms

It is possible to abort an ongoing alarm alignment process by invoking the action *abortGetAlarmList*. Also in this case the notification *notifyAlarmAlignmentEnd* is emitted.

4.2 Mapping

The semantics of the Alarm IRP is defined in 3GPP TS 32.111-2 [9]. The definitions of the management information defined there are independent of any implementation technology and protocol. This clause maps these protocol-independent definitions onto the equivalences of the CMIP solution set of Alarm IRP.

4.2.1 Mapping of Information Object Classes

For this Alarm IRP CMIP Solution Sets, the Information Object Classes (IOC) and the Interfaces defined in 3GPP TS 32.111-2 [9] are mapped to a Managed Object Classes (MOC) named alarmControl which includes all the Attributes, Actions and Notifications necessary to model the management described in (3GPP TS 32.111-2 [9]).

4.2.2 Mapping of Operations

Table 1 maps the Interface/Operations defined in the IS of the Alarm IRP to their equivalents in the CMIP SS. The equivalents are qualified as Mandatory (M) or Optional (O).

Table 1: Mapping of Operations

IS Interface	IS Operation	CMIP SS Equivalent		Qualifier
	acknowledgeAlarms	CMISE M-ACTION service, action type: acknowledgeAlarms		М
AlarmIRPOperations_1	getAlarmList	CMISE M-ACTION service, action type: getAlarmList environmentalAlarm equipmentAlarm qualityofServiceAlarm processingErrorAlarm communicationsAlarm integrityViolation operationalViolation physicalViolation securityServiceOrMechanismViolation timeDomainViolation CMISE M-EVENT-REPORT service, event type: notifyAlarmAlignmentEndRo	ITU-T X.721 [4]	М

GenericIRPProfileOperation	getNotificationProfile	CMISE M-ACTION service, action type: getAlarmIRPNotificationPro	ofile	0
Genericik Fronte Operation	getOperationProfile	CMISE M-ACTION service, action type: getAlarmIRPOperationProf		0

NOTE: The Interfaces GenericIRPVersionOperation and GenericIRPProfileOperation are defined in 3GPP TS 32.312 [11].

4.2.3 Mapping of Operation Parameters

The tables in the following clauses show the parameters of each operations defined in the IS 3GPP TS 32.111-2 [9] and their equivalents in this CMIP SS.

The input parameters of the operations are mapped into "Action information" (see GDMO and ASN.1 definitions for more details).

The output parameters of the operations are mapped into "Action response" (see GDMO and ASN.1 definitions for more details).

Table 2: Parameter mapping of the operation acknowledgeAlarms

4.2.5 Mapping of Notification Parameters

In the CMIP Solution Set, all the notifications originated within the Agent are reported to the Managers by means of the CMISE "M-EVENT-REPORT" primitive, which is implemented by means of the "m-EventReport OPERATION" (see ITU-T Recommendations X.710 [2] and X.711 [3]). The argument of m-EventReport OPERATION is defined in ITU-T Recommendation X.711 [3] as follows:

where eventInfo is further specified, for each specific notification, by means of specific GDMO/ASN.1 definitions.

In the following tables, for the notifications defined in [9], all parameters are mapped to their CMIP SS equivalents. Note that the parameter mapping for the notification notifyChangedAlarm is not given. This is because in the CMIP SS the notifications notifyClearedAlarm and notifyNewAlarm are emitted instead of the notification notifyChangedAlarm.

The IS parameter systemDN defined in [9] (Alarm IRP: Information Services) is conditional and not used in the CMIP SS.

The IS parameter *alarmType* has no direct CMIP SS equivalent. Instead the value of this parameter is reflected by the type of the emitted notification. More specifically:

- If the alarm type is equal to 'Communications Alarm' the notification *communicationsAlarm* is emitted;
- If the alarm type is equal to 'Processing Error Alarm' the notification *processingErrorAlarm* is emitted;
- If the alarm type is equal to 'Environmental Alarm' the notification environmental Alarm is emitted;
- If the alarm type is equal to 'Quality of Service Alarm' the notification quality of Service Alarm is emitted;
- If the alarm type is equal to 'Equipment Alarm' the notification equipmentAlarm is emitted.
- If the alarm type is equal to 'Integrity Violation' the notification integrity Violation is emitted.
- If the alarm type is equal to 'Operational Violation' the notification operational Violation is emitted.
- If the alarm type is equal to 'Physical Violation' the notification physical Violation is emitted.
- If the alarm type is equal to 'Security Violation 'the notification securityServiceOrMechanismViolation is emitted.
- If the alarm type is equal to 'Time Domain Violation 'the notification timeDomainViolation is emitted.

Also the IS parameter *alarmId* is not mapped directly to a parameter in the CMIP SS. This is not required because an alarm is identified unambiguously by the notification identifier of the notification reporting the alarm the first time and, if the notification identifier is not unique across the IRPAgent, by the instance of the managed object emitting this notification. Notifications referring to an alarm already reported (e.g. *notifyClearedAlarm*, *notifyAckStateChanged*, *notifyComments*) do so by specifying in the M-EVENT REPORT parameter 'Event information': *correlatedNotifications* (ITU-T Recommendations X.721 [4], X.733 [5] and X.736 [12]) the notification identifier of the notification having reported the new alarm and, if required, the instance of the object having emitted this notification.

Most parameters are mapped to the M-EVENT report parameter 'Event information'. For the notifications notifyNewAlarm(when reporting alarms not related to security), notifyClearedAlarm, notifyAckStateChanged and notifyComments the syntax and semantics of this structured parameter are defined in ITU-T X.721 [4] by the ASN.1 definition AlarmInfo. In case notifyNewAlarm reports a security alarm, the 'Event information' parameter is described by SecurityAlarmInfo, defined in ITU-T X.721 [4] as well. For the other notifications (notifyAlarmListRebuilt, notifyPotentialFaultyAlarmList) the 'Event information' parameter is described by ASN.1 definitions defined in this document.

Table 12: Parameter mapping of the notification notifyNewAlarm for alarms not related to security

DEFINED AS

"The MOC alarmControl has been defined to provide information to the Manager about the currently alarms controlled by the Agent.

An instance of the 'alarmControl' MOC is identified by the value of the attribute 'alarmControlId'.

The attribute 'alarmsCountSummary' provides a summary of the number of alarms managed in the Agent's alarm list (including the number of cleared but not yet acknowledged alarms).

The action 'getAlarmList' is the means, for the Manager, to trigger an alarm alignment procedure in accordance with the parameter specified in the action request (this may be needed e.g. for first time alignment or after a link interruption between the Agent and the Manager). The alarm list is sent as a sequence of single alarm reports.

The notification 'notifyAlarmListRebuilt' is sent by the Agent to the Manager to inform that the alarm list has changed. It is recommended that the Manager subsequently triggers an alarm alignment.

The notification 'notifyAlarmAlignmentEnd' is sent by the Agent to the Manager to inform that the alarm alignment process identified by the 'alignmentId' is completed.";

acknowledgeAlarmsBehaviour BEHAVIOUR

DEFINED AS

"The behaviour of this functionality is defined within 32.111-2 – below provides an overview and CMIP specific semantics.

This action is invoked by the Manager to indicate to the Agent that one or several alarms (previously sent by the Agent as alarm notifications) have to be acknowledged. In the action request the NM supplies the parameter ackUserId and ackSystemId. The other acknowledgement history parameters, i.e. alarm acknowledgement state (in this case acknowledged) and the acknowledgement time are set by the Agent itself.

The 'Action information' field contains the following data:

• alarmReferenceList

This parameter contains a set of MOI (Managed Object Instance) and *notificationIdentifier*. Each pair identifies unambiguously in the scope of the Agent an alarm (previously received by the NM) that have to be now acknowledged. MOI can be absent if scope of uniqueness of notificationIdentifier is across the IRPAgent.

• ackUserId

It contains the name of the operator who acknowledged the alarm or a generic name (dependent on the operational concept). It may have also the value NULL.

ackSystemId

It indicates the management system where the acknowledgment is triggered. It may have also the value NULL.

The 'Action response' contains the following data:

status

This parameter contains the results of the NM acknowledgement action. Possible values: noError (0, all alarms found and ack state changed according to the manager request), ackPartlySuccessful (some alarms not found / not changeable, see next parameter), error (value indicates the reason why the complete operation failed).

errorAlarmReferenceList

This parameter (significant only if *status* = ackPartlySuccessful) contains the list of moi (managed object instance) and notificationIdentifier pairs of the alarms which could not be acknowledged and, for each alarm, also the reason of the error.";

TS32-111-4TypeModule.GetAlarmCountReply;

REGISTERED AS {ts32-111AlarmAction 2};

getAlarmCountBehaviour BEHAVIOUR

DEFINED AS

"The behaviour of this functionality is defined within 32.111-2 – below provides an overview and CMIP specific semantics.

The NM invokes this action to receive the number of available alarms in the Agent' alarm list according to the specification in the action request. The Manager may use this action to find out the number of alarms in the alarm list before invoking a synchronisation by means of the *getAlarmList* operation. The request is possible also before the Manager creates an own event forwarding discriminator instance within the Agent.

The 'Action information' field contains the following data:

alarmAckState

Depending on this optional parameter value, the NM gets the number of alarms of each *perceivedSeverity* value according to the following possible choices:

- all alarms
- all active alarms (acknowledged or not yet acknowledged)
- all active and acknowledged alarms
- all active and unacknowledged alarms
- all cleared and unacknowledged alarms.

If the parameter is absent, all alarms from the Agent's alarm list are taken into consideration.

filter

The handling of this optional parameter is as follows:

- if present and not NULL, it indicates a filter constraint which shall apply in the calculation of the results
- if its value is NULL, no filter shall be considered and the Agent shall return the number of all alarms according to the value of the parameter *alarmAckState* (see above)
- if absent, the handling depends on the availability of an event forwarding discriminator instance within the Agent. If this instance is valid, the filter construct of the event forwarding discriminator shall apply. If no EFD instance is available, the Agent shall return the number of all alarms according to the value of the above-mentioned parameter *alarmAckState*.

The 'Action response' is composed of:

- The numbers of alarms for each *perceivedSeverity* value (if applicable).
- The parameter *status* containing the results of the NM action. Possible values: noError (0), error (the value indicates the reason of the error).";

getAlarmList ACTION

BEHAVIOUR

getAlarmListBehaviour;

MODE

CONFIRMED:

WITH INFORMATION SYNTAX

TS32-111-4TypeModule.GetAlarmListInfo;

WITH REPLY SYNTAX

TS32-111-4TypeModule.GetAlarmListReply;

REGISTERED AS {ts32-111AlarmAction 3};

getAlarmListBehaviour BEHAVIOUR

DEFINED AS

"This action starts an alarm alignment procedure between a NM and Agent, which takes into account the acknowledgment state of the alarms and a dedicated filter (valid only for the current request).

The 'Action information' field contains the following data:

• alarmAckState

Depending on this optional parameter value, the NM gets the alarm reports according to the following possible choices:

- all alarms
- all active alarms (acknowledged or not yet acknowledged)
- all active and acknowledged alarms
- all active and unacknowledged alarms
- all cleared and unacknowledged alarms.

If the parameter is absent, all alarms from the Agent's alarm list are taken into consideration.

baseObjectClass

This parameter carries the object class of the managed object instance identified by the *baseObjectInstance* parameter.

baseObjectInstance

This parameter carries the DN of a certain managed object instance. Only alarm information instances related to this managed object and its subordinate objects shall be provided.

• destination

This parameter identifies the destination to which the alarm reports that have passed the test conditions specified in the parameter 'filter' are sent. According to ITU-T Recommendation X.721 [4], if no destination is specified in the request, then the discriminator is created with the destination defaulted to the AE-Title of the invoker.

filter

The handling of this optional parameter (valid only for the current alignment request) is as follows:

- if present and not NULL, it indicates a filter constraint which shall apply in the forwarding of the alignment-related alarm reports
- if its value is NULL, no real filter shall be considered and the Manager receives the alarms according to the value of the parameter *alarmAckState* (see above).

The 'Action response' contains the following data:

alignmentId

The parameter is defined by the Agent and identifies unambiguously the current alarm alignment procedure. It allows the Manager to distinguish between alarm reports sent as consequence of several own alignment requests triggered in parallel.

status

The parameter contains the results of the NM action. Possible values: noError (0), error (the value indicates the reason of the error).

After the action response is forwarded to the NM, the Agent sends the alarm list as a sequence of single alarm notifications in accordance with the values of the request parameters. Every alarm notification contains all fields of the alarm stored in the alarm list. In particular:

- The field additionalText contains at the beginning the string '(ALIGNMENTEND-alignmentId)' to allow a Manager to recognise that this alarm report is sent due to a previous getAlarmList request.
- If available, the data related to the acknowledgment history (i.e. ackState, ackTime, ackUserId, ackSystemId) are provided in the field *additionalInformation*.

Further details about the implementation of this operation are provided in the 'Introduction'.";

 $unacknowledge Alarms Behaviour \ \textbf{BEHAVIOUR}$

DEFINED AS

"The behaviour of this functionality is defined within 32.111-2 – below provides an overview and CMIP specific semantics.

This action is used by the Manager to indicate to the Agent that one or several alarms (previously acknowledged) have to be unacknowledged. Subsequently the 'acknowledgement history' information of these alarms in the Agent's alarm list is completely removed (this operation may be used by operators in case of a previous acknowledgement by mistake).

The 'Action information' field contains the following data:

• alarmReferenceList

This parameter contains a set of MOI (Managed Object Instance) and *notificationIdentifier pair*. Each of them identifies unambiguously in the scope of the Agent an alarm (previously acknowledged by the NM) that have to be now unacknowledged. MOI can be absent if scope of uniqueness of notificationIdentifier is across the IRPAgent.

ackUserId

It contains the name of the operator who unacknowledged the alarm or a generic name (dependent on the operational concept). It may have also the value NULL. Note that only the user who previously acknowledged the alarm is allowed to un-acknowledge it later.

ackSystemId

It indicates the management system where the acknowledgment is triggered. It may have also the value NULL. Note that the un-acknowledgement is allowed only at the management system where previously the acknowledgement took place.

The 'Action response' contains the following data:

status

This parameter contains the results of the NM un-acknowledgement action. Possible values: noError (0, all alarms found and ack state changed according to the manager request), unackPartlySuccessful (some alarms not found / not changeable, see next response parameter), error (value indicates the reason why the complete operation failed).

• errorAlarmReferenceList

This parameter (significant only if *status* = unackPartlySuccessful) contains the list of MOI (Managed Object Instance) and notificationIdentifier pairs of the alarms which could not be unacknowledged and, for each alarm, also the reason of the error. MOI can be absent if scope of uniqueness of notificationIdentifier is across the IRPAgent. ";

-- 5.3.9 clearAlarms (O)

clearAlarmsBehaviour BEHAVIOUR

DEFINED AS

"The behaviour of this functionality is defined within 32.111-2 – below provides an overview and CMIP specific semantics.

This action is invoked by the IRPManager to clear manually one or multiple alarms. The M-ACTION request parameter 'Action information' *ClearAlarmsInfo* is composed of the following fields:

• alarmReferenceList

This mandatory parameter identifies the alarms to be cleared. Each alarm is identified by the notification identifier of the notification that reported the alarm the first time and, if the notification identifier is not unique across the IRPAgent, by the instance of the managed object that emitted this notification.

• clearUserId

This mandatory parameter identifies the user that has invoked the *clearAlarms* operation.

clearSystemId

This optional parameter identifies the system on which the IRPManager, where the *clearAlarms* operation has been invoked, is running. This parameter may be absent.

The M-ACTION response parameter 'Action Reply' ClearAlarmsReply is composed of the following fields

• errorAlarmReferenceList

This mandatory parameter identifies alarms that are specified in the *alarmReferenceList*, but which could not be cleared. The alarms are specified by the notification identifier of the notification that reported the alarm the first time and, if required, the instance of the managed object that emitted this notification. In addition to this, the parameter specifies for every alarm that could not be cleared the error reason. If all alarms specified in the *alarmReferenceList* exist and could be cleared, this parameter contains no information. If the operation failed completely due to a general error, this parameter is not significant.

status

This mandatory parameter provides informations about the result of the operation. If all alarms specified in the *alarmReferenceList* exist and are cleared, the value *noError* (0) is returned. If some alarms specified do not exist or could not be cleared, the value *clearPartlySuccessful* () is returned. In this case the parameter *errorAlarmReferenceList* provides additional information. If the operation failed completely due to a general error, this parameter returns the error reason.";

Annex B (informative): Change history

				-	Change history		
Date	TSG #	TSG Doc.	CR	Rev	Subject/Comment	Old	New
Mar 2000	S_07	SP-000012			Approved at TSG SA #7 and placed under Change Control	2.0.0	3.0.0
Mar 2000					cosmetic	3.0.0	3.0.1
Jun 2000	S_08	SP-000254	005		Split of TS - Part 4: Alarm Integration Reference Point (IRP): CMIP Solution Set (SS)	3.0.1	3.1.0
Sep 2000		1			cosmetic	3.1.0	3.1.1
Jun 2001	S_12	SP-010282	001		Alarm IRP: CMIP SS Rel4 - Addition of feature. As SA5 had not reviewed this part, it is submitted to SA#12 for Information only.	3.1.1	
Sep 2001	S_13	SP-010470	001	1	Addition of features	3.1.1	4.0.0
	S_14	SP-010640			Change of qualifier for setComment and notifyComment	4.0.0	4.1.0
	S_14	SP-010640	004		Addition of missing parameter in notifyComments	4.0.0	4.1.0
Mar 2002		SP-020028	005		Addition of "perceivedSeverity" as parameter to "acknowledgeAlarms" operation (CMIP SS)	4.1.0	4.2.0
Mar 2002	S 15				Automatic upgrade to Rel-5 (no Rel-5 CR)	4.2.0	5.0.0
	S_16	SP-020283	007		Correction of errors and ambiguities in the Parameter Mapping Tables and ASN.1 Definitions		5.1.0
Jun 2002	S_16	SP-020284	800		Addition of the parameter alarmListAlignmentRequirement to the notification notifyAlarmListRebuilt in the CMIP SS (32.111-4)	5.0.0	5.1.0
Jun 2002	S_16	SP-020284	009		Adding the notification notifyPotentialFaultyAlarmList in the CMIP SS (32.111-4)	5.0.0	5.1.0
Jun 2002	S_16	SP-020284	010		Introduction of SS (32.111-4) to IS (32.111-2) relation and correction of	5.0.0	5.1.0
					Foreword		
Sep 2002		SP-020480			Alignment with 32.111-2 on Alarm Clearance Functionality	5.1.0	5.2.0
Dec 2002	S_18	SP-020751	013		Add the additionalInformation parameter in notifyNewAlarms to the Alarm IRP CMIP SS (Alignment with Information Service in Rel-5 32111-2)	5.2.0	5.3.0
Dec 2002	S_18	SP-020753	014		Addition of Security Alarm Support to the Alarm IRP CMIP SS (Alignment with Information Service in Rel-5 32111-2)	5.2.0	5.3.0
Mar 2003	S_19	SP-030063	016		Correction to Alarm Comments- alignment with 32.111-1	5.3.0	5.4.0
Mar 2003	S_19	SP-030138	017		Add missing x721AlarmNotificationsPackage	5.3.0	5.4.0
Mar 2003	S_19	SP-030138	018		Corrections to GDMO and ASN.1 definitions in the Alarm IRP CMIP SS	5.3.0	5.4.0
Jun 2003	S_20	SP-030277	019		Correction of Compilation Errors	5.4.0	5.5.0
Jun 2003	S_20	SP-030277	020		Addition of missing reasons for the emission of notifyAlarmListRebuilt	5.4.0	5.5.0
Sep 2003	S_21	SP-030416	022		Correction of syntax error in type SetCommentInfo	5.5.0	5.6.0
Dec 2003		SP-030627	023		Add missing parts for the support of security alarms	5.6.0	5.7.0
Dec 2003	S_22	SP-030627	024		Mapping completion of getAlarmList	5.6.0	5.7.0
Dec 2003	S_22	SP-030629	025		Align operation getAlarmList with the notification notifyAlarmListRebuilt	5.7.0	6.0.0
Jan 2004					Editorial (Tables & CMIP code cosmetics)	6.0.0	6.0.1
Mar 2004	S_23	SP-040120	026		Addition of a method to abort an ongoing alarm alignment process in the asynchronous mode of the operation getAlarmList	6.0.1	6.1.0
Sep 2004	S_25	SP-040561	028		Align with the IS 32.111-2 the possibility to apply filters to notification parameters	6.1.0	6.2.0
Dec 2004	S_26	SP-040791	029		Remove redundant ackTime parameter in notifyAckStateChanged	6.2.0	6.3.0
