# ETSITS 134 108 V5.1.0 (2004-06)

Technical Specification

Universal Mobile Telecommunications System (UMTS); Common test environments for User Equipment (UE) conformance testing (3GPP TS 34.108 version 5.1.0 Release 5)

Reference
RTS/TSGT-0134108v510

Keywords

UMTS

# Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

#### **Foreword**

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <a href="http://webapp.etsi.org/key/queryform.asp">http://webapp.etsi.org/key/queryform.asp</a>.

#### **Foreword**

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

### Introduction

The definition of the Conformance Tests for UE in 3G will be a complex task as the complete test suite covers RF, EMC and Protocol aspects of the UE.

Each test requires a Test Environment to be defined in which the UE has to operate to defined standards, constraints and performance. The overall task can be simplified if there are a number of well defined and agreed Common Test Environments where every one can be used for a number of tests. Hence the present documents defines testing conditions that are common to several tests avoiding the need to duplicate the same information for every single test.

The present document defines default values for a variety of common areas. Where values are not specified in test cases, the defaults in the present document will apply. If specified, the test case values will take precedence.

The present document addresses the FDD mode as well as the TDD mode.

# 1 Scope

The present document contains definitions of reference conditions and test signals, default parameters, reference radio bearer configurations used in radio bearer interoperability testing, common radio bearer configurations for other test purposes, common requirements for test equipment and generic set-up procedures for use in UE conformance tests.

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.

Telephone Network (PSTN)".

• For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

# 3 Definitions and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in [9], [10] and the following apply:

**Maximum average power:** average transmitter output power obtained over any specified time interval, including periods with no transmission, when the transmit time slots are at the maximum power setting

### 3.2 Abbreviations

Direct transfer

DT

For the purposes of the present document, the abbreviations given in [9], [10] and the following apply:

| $I_{oc}$ | The power spectral density of a band limited white noise source (simulating interference from other cells) as measured at the UE antenna connector. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| AFC      | Automatic Frequency Control                                                                                                                         |
| AM       | Acknowledgement mode                                                                                                                                |
| ATT      | Attenuator                                                                                                                                          |

UM Unacknowledgement mode

# 4 Common requirements of test equipment

Mobile conformance testing can be categorised into 3 distinct areas:

- RF Conformance Testing.
- EMC Conformance Testing.
- Signalling Conformance Testing.

The test equipment required for each category of testing may or not be different, depending on the supplier of the test equipment. However, there will be some generic requirements of the test equipment that are essential for all three categories of test, and these are specified in this clause.

In addition, there will be requirements to test operation in multi-system configurations (eg UTRA plus GSM/DCS1800). However, these would not form a common test equipment requirement for the three test areas and are not considered in the present document.

# 4.1 General Functional Requirements

NOTE: This clause has been written such that it does not constrain the implementation of different architectures and designs of test equipment.

All test equipment used to perform conformance testing on a UE shall provide a platform suitable for testing UE's that are either:

- a) FDD Mode; or
- b) TDD Mode; or
- c) both FDD/TDD Modes.

All test equipment shall provide (for the mode(s) supported) the following minimum functionality.

- The capability of emulating a single UTRA cell with the appropriate channels to allow the UE to register on the cell.
- The capability to allow the UE to set up an RRC connection with the System Simulator, and to maintain the connection for the duration of the test.

- The capability (for the specific test):
  - to select and support an appropriate Radio Bearer for the downlink;
  - to set the appropriate downlink power levels;
  - to set up and support the appropriate Radio Bearer for the uplink;
  - to set and control the uplink power levels.

# 4.2 Minimum performance levels

#### 4.2.1 Supported Cell Configuration

The System Simulator shall provide the capability to simulate a minimum number of cells (of the appropriate UTRA Mode) whose number and capabilities are governed by the test cases that need to be performed (test cases are defined in [1] (Signalling), [2] (RF-FDD) and [5] (RF-TDD)). For this purpose test cases can be split into two different categories: Tests that require only one cell and Tests that require several cells.

To perform test cases requiring one cell, the system simulator must provide a Cell offering the capabilities to perform all the test cases in this category.

To perform test cases requiring several cells, additional cells must be provided by the system simulator. The additional cells, however, need only provide a minimum set of capabilities so as to support the first cell in carrying out the multicell test cases.

The type and number of channels (especially physical channels) constitute an important set of capabilities for a cell. The following clauses list possible channels that may be supported by the SS. Each channel type, however, and the minimum number of channels needed are only mandatory if specific test cases require them.

The mapping between Logical and Transport channels is as described in [7]. Similarly the mapping between Transport channels and Physical channels is as described in 3GPP TS 25.211 for the FDD mode, and 3GPP TS 25.221 for the TDD mode. The reference measurement channels (mapping between Transport channels and Physical channels for DTCH/DCCH to be tested) are defined in [2] annex C for FDD and [5] annex C for TDD.

#### 4.2.1.1 Supported Channels for FDD Mode

#### 4.2.1.1.1 Logical Channels

| Logical Channel Minimum Number |               | Comments                                                                        |  |  |
|--------------------------------|---------------|---------------------------------------------------------------------------------|--|--|
| BCCH                           | 1             |                                                                                 |  |  |
| СССН                           | 1             |                                                                                 |  |  |
| DCCH                           | 4             | 2 for RRC testing, 2 for NAS testing                                            |  |  |
| PCCH                           | 1             |                                                                                 |  |  |
| DTCH                           | n <ffs></ffs> | Depending on SS's support for RB service testing (See clause 14 of TS 34.123-1) |  |  |

#### 4.2.1.1.2 Transport Channels

| Transport Channel | Minimum Number | Comments            |
|-------------------|----------------|---------------------|
| BCH               | 1              |                     |

|                  |                | This channel is commonly used by the UEs having no RRC                                                                 |  |  |  |  |
|                  |                | connection with the network and by the UEs using common                                                                |  |  |  |  |
|                  |                | transport channels when accessing a new cell after cell                                                                |  |  |  |  |
|                  |                | reselection.                                                                                                           |  |  |  |  |
| DCCH             | 4              | Dedicated Control Channel: A point-to-point bi-directional                                                             |  |  |  |  |
|                  |                | channel that transmits dedicated control information between                                                           |  |  |  |  |
|                  |                | a UE and the network. This channel is established through                                                              |  |  |  |  |
|                  |                | RRC connection setup procedure. 2 channels for RRC testing                                                             |  |  |  |  |
| 2001             |                | and 2 channels for NAS testing estimated.                                                                              |  |  |  |  |
| PCCH             | 1              | Paging Control Channel: DL channel that transfers paging                                                               |  |  |  |  |
|                  |                | information. This channel is used when the network does not                                                            |  |  |  |  |
|                  |                | know the location cell of the UE, or, the UE is in the cell                                                            |  |  |  |  |
| 0110011          | 4              | connected state                                                                                                        |  |  |  |  |
| SHCCH            | 1              | Shared Channel Control Channel: Bi-directional channel that                                                            |  |  |  |  |
|                  |                | transmits control information for uplink and downlink shared channels between network and UEs. This channel is for TDD |  |  |  |  |
|                  |                |                                                                                                                        |  |  |  |  |
|                  | Т              | only. raffic Channels                                                                                                  |  |  |  |  |
| DTCH             |                |                                                                                                                        |  |  |  |  |
| DICH             | 1              | Dedicated Traffic Channel is a point-to-point channel, dedicated to one UE, for the transfer of user information. A    |  |  |  |  |
|                  |                | DTCH can exist in both UL and DL.                                                                                      |  |  |  |  |
| СТСН             | 1              | Common Traffic Channel is a point-to-multipoint unidirectional                                                         |  |  |  |  |
|                  |                | channel for transfer of dedicated user information for all or a                                                        |  |  |  |  |
|                  |                | group of specified UEs.                                                                                                |  |  |  |  |
|                  |                | group or specified OES.                                                                                                |  |  |  |  |

# 4.2.1.2.2 Transport Channels

| Transport Channel | Minimum Number | Comments                                                       |  |
|-------------------|----------------|----------------------------------------------------------------|--|
| ВСН               | 1              | Broadcast Channel: DL channel used to broadcast system         |  |
|                   |                | and cell-specific information.                                 |  |
| FACH              | 1              | Forward Access Channel: DL channel used to carry control       |  |
|                   |                | information to a mobile station when the system knows the      |  |
|                   |                | location cell of the mobile station (may also carry short user |  |
|                   |                | packets).                                                      |  |
| PCH               | 1              | Paging Channel: DL channel used to carry control information   |  |
|                   |                | to a mobile station when the system does not know the          |  |
|                   |                | location cell of the mobile station.                           |  |
| DCH               | 2              | Dedicated Channel:UL or DL channel used to carry user or       |  |
|                   |                | control information between the UTRAN and a UE                 |  |
| DSCH              | 1              | DL shared channel: DL channel shared by several UEs            |  |
|                   |                | carrying dedicated control or traffic data.                    |  |
| USCH              | 1              | UL shared channel: UL channel shared by several UEs            |  |
|                   |                | carrying dedicated control or traffic data.                    |  |
| RACH              | 1              | Random Access Channel: UL channel used to carry control        |  |
|                   |                | information from mobile station. The RACH may also carry       |  |
|                   |                | short user packets.                                            |  |

# 4.2.1.2.3 Physical Channels (3.84 Mcps option)

| Physical Channel | Minimum Number | Comments                                                                                                                                                                                                                                            |  |  |
|------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|
| P-CCPCH          | 1              | Primary Common Control Physical Channel The BCH as described in subclause 4.2 is mapped onto the P-CCPCH. The position (time slot / code) of the P-CCPCH is known from PSCH.                                                                        |  |  |
| SCH              | 1              | Synchronisation Channel. Code group of a cell can be derived from the synchronisation channel. In order not to limit the uplink/downlink asymmetry the SCH is mapped on one or two downlink slots per frame only.                                   |  |  |
| S-CCPCH          | 2              | Secondary Common Control Physical Channel. PCH and FACH as described in subclause 4.2 are mapped onto one or more S-CCPCH.                                                                                                                          |  |  |
| PICH             |                | Paging Indicator Channel is a physical channel used to carry the paging indicators.                                                                                                                                                                 |  |  |
| DPCH (DL)        | 3              | Downlink Dedicated Physical Channel. DCH channels are mapped onto DPCH                                                                                                                                                                              |  |  |
| PDSCH            | 1              | Physical Downlink Shared Channel. DSCH as desribed in subclause 4.2 is mapped onto one or more PDSCH.                                                                                                                                               |  |  |
| DPCH (UL)        | 1              | Uplink Dedicated Physical Channel. DCH channels are mapped onto DPCH.                                                                                                                                                                               |  |  |
| PUSCH            | 1              | Physical Uplink Shared Channel. The USCH as desribed in subclause 4.2 is mapped onto one or more PUSCH. Timing advance, as described in TS-25.224, subclause 4.3, is applied to the PUSCH.                                                          |  |  |
| PRACH            | 2              | Physical Random Access Channel. The RACH as described in subclause 4.2 is mapped onto PRACH                                                                                                                                                         |  |  |
| PNBSCH           | 1              | Physical node B synchronisation channel: In case cell sync bursts are used for Node B synchronisation the PNBSCH shall be used for the transmission of the cell sync burst TS 25.223. The PNBSCH shall be mapped on the same timeslot as the PRACH. |  |  |

#### 4.2.1.2.4 Physical Channels (1.28 Mcps option)

| Physical Channel | Minimum Number | Comments                                                                                                                                                                                                                                                                                                                              |  |  |
|------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|
| P-CCPCH          | 2              | Primary Common Control Physical Channel.The BCH as described in section 4.1.2 "Common Transport Channels" is mapped onto the P-CCPCH1 and P-CCPCH2. The position (time slot / code) of the P-CCPCHs is fixed in the 1.28Mcps TDD. The P-CCPCHs are mapped onto the first two code channels of timeslot#0 with spreading factor of 16. |  |  |
| DwPCH            | 1              | Synchronisation Channel for DL. Present in each 5 ms subframe.                                                                                                                                                                                                                                                                        |  |  |
| UpPCH            | 1              | Synchronisation Channel for UL. Present in each 5 ms subframe.                                                                                                                                                                                                                                                                        |  |  |
| S-CCPCH          | 2              | Secondary Common Control Physical Channel. PCH and FACH as described in subclause 4.1.2 are mapped onto one or more S-CCPCH.                                                                                                                                                                                                          |  |  |
| PICH             |                | Paging Indicator Channel is a physical channel used to carry the paging indicators.                                                                                                                                                                                                                                                   |  |  |
| DPCH (DL)        | 3              | Downlink Dedicated Physical Channel.DCH channels are mapped onto DPCH                                                                                                                                                                                                                                                                 |  |  |
| PDSCH            | 1              | Physical Downlink Shared Channel. PDSCH provides the possibility for transmission of TFCI, SS, and TPC in downlink.                                                                                                                                                                                                                   |  |  |
| DPCH (UL)        | 1              | Uplink Dedicated Physical Channel. DCH channels are mapped onto DPCH.                                                                                                                                                                                                                                                                 |  |  |
| PUSCH            | 1              | Physical Uplink Shared Channel. PUSCH provides the possibility for transmission of TFCI, SS, and TPC in uplink.                                                                                                                                                                                                                       |  |  |
| FPACH            | 1              | Fast Physical Access Channel. FPACH is used by the Node B to carry, in a single burst, the acknowledgement of a detected signature with timing and power level adjustment indication to a user equipment.                                                                                                                             |  |  |
| PRACH            | 2              | Physical Random Access Channel. The RACH as described in subclause 4.2 is mapped onto one or more uplink physical random access channels (PRACH).                                                                                                                                                                                     |  |  |

#### 4.2.1.3 Support of T<sub>cell</sub> timing offset

In test case parameter declarations, the parameter  $T_{cell}$  may be specified between 0 to 38399, to allow for extensibility. However, the system simulator is required only to support a maximum  $T_{cell}$  value of 2304, with a step resolution of 256. The SS may limit a  $T_{cell}$  value of greater than 2304, and may round  $T_{cell}$  to the nearest multiple of 256.

#### 4.2.2 RF Performance

#### 4.2.2.1 Frequency of Operation

The System Simulator shall be capable of adjusting the Carrier Frequency of the DL channels to any frequency allowed in the DL frequency band. The DL frequency shall be accurate to the level of accuracy set by the core specications [20] for FDD and [21] for TDD.

For RF tests, the requirement of Test Equipment is described in [2] annex F for FDD and [5] annex F for TDD respectively.

#### 4.2.2.2 Power Level Setting Accuracy

The system simulator shall be able to adjust the average power output of the DL Channels to meet the absolute accuracy of the system simulator DL power levels covered in clause 5.4.1 Downlink Signal Levels.

For RF tests, the requirement of Test Equipment is described in [2] annex F for FDD and [5] annex F for TDD respectively.

The system simulator shall be capable of altering the power of the DL Dedicated channels under control of the UE Layer 1 Signalling information.

#### 4.2.2.3 Uplink Power Control

The system simulator shall be able to command the UE to transmit at the maximum level for its power class or a lower level required for specific tests. The system simulator shall also provide the capability of generating the Layer 1 Signalling information to set the power levels of the Uplink Dedicated Channels from the UE to lower levels if required.

#### 4.2.2.4 Uplink Signal Handling

For FDD mode, the System Simulator shall not be damaged by a Power Class 1 UE transmitting at the maximum power level permitted in [11] and for TDD mode by a Power Class 2 UE transmitting at the maximum power level permitted in [12].

#### 4.2.2.5 Uplink Sensitivity

The simulator shall be able to receive uplink transmissions from the UE when it is transmitting at the minimum power level defined in [11] for FDD mode, and [12] for TDD mode.

Editor's note: this is obviously a useful feature for the system simulator; however it is <ffs> if it should be an essential common requirement for a protocol test system.

#### 4.2.3 Timers Tolerances

All the timers used during testing are within a tolerance margin given by the equation below. If for a specific test a different tolerance value is required then this should be specified in the relevant test document (i.e. the document where the test is described).

Timer tolerance = 10%, or  $2 * TTI + t_{delta}$ , whichever value is the greater.

Where  $t_{delta}$  is 55 ms.

# 5 Reference Test Conditions

# 5.1 Test frequencies

The test frequencies are based the UMTS frequency bands defined in the core specifications.

To avoid interference with adjacent frequency bands the lowest test frequency (downlink and uplink) needs to be offset upwardly by at least 2,6 MHz since the channel's width is 5 MHz for FDD and 3.84 Mcps TDD option, and 0.8 MHz for 1.28 Mcps TDD option since the channel's width is 1.6 MHz. The raster spacing is 200KHz. Similarly the highest test frequency (downlink and uplink) needs to be offset downwardly by at least 2.6 MHz for FDD and 3.84 Mcps TDD option, and 0.8 MHz for 1.28 Mcps TDD option.

NOTE1: Additional regulations concerning interferences to frequency bands used by different systems may also exist. Those regulations are specific to the country where the test equipment is used and need to be taken into account if they require a higher offset than 2,6 MHz from the edge frequencies for FDD and 3.84 Mcps TDD option, and 0.8 MHz for 1.28 Mcps TDD option.

NOTE2: In Band VI, to avoid interference with adjacent frequency bands the lowest test frequency (downlink and uplink) needs to be offset upwardly by at least 2,5 MHz, highest test frequency (downlink and uplink) needs to be offset downwardly by at least 2,5 MHz from the edge frequencies since additional center frequencies are specified according to [11].

# 5.1.1 FDD Mode Test frequencies

UTRA/FDD is designed to operate in one of three paired bands [11]. The reference test frequencies for the common test environment for each of the 4 operating bands are defined in the following tables:

#### 5.1.1.1 FDD reference test frequencies for Operating Band I

| Test Frequency ID | UARFCN | Frequency of Uplink | UARFCN | Frequency of Downlink |
|-------------------|--------|---------------------|--------|-----------------------|
| Low Range         | 9 613  | 1 922.6 MHz         | 10 563 | 2 112.6 MHz           |
| Mid Range         | 9 750  | 1 950.0 MHz         | 10 700 | 2 140.0 MHz           |
| High Range        | 9 887  | 1 977.4 MHz         | 10 837 | 2 167.4 MHz           |

#### 5.1.1.2 FDD reference test frequencies for Operating Band II

| Test Frequency ID | UARFCN | Frequency of Uplink | UARFCN | Frequency of Downlink |
|-------------------|--------|---------------------|--------|-----------------------|
| Low Range         | 9 263  | 1 852.6 MHz         | 9 663  | 1 932.6 MHz           |
| Mid Range         | 9 400  | 1 880 MHz           | 9 800  | 1 960 MHz             |
| High Range        | 9 537  | 1 907.4 MHz         | 9 937  | 1 987.4 MHz           |

#### 5.1.1.3 FDD reference test frequencies for Operating Band III

| Test Frequency ID | UARFCN | Frequency of Uplink | UARFCN | Frequency of Downlink |
|-------------------|--------|---------------------|--------|-----------------------|
| Low Range         | 8 563  | 1 712.6 MHz         | 9 038  | 1 807.6 MHz           |
| Mid Range         | 8 737  | 1 747.4 MHz         | 9 212  | 1 842.4 MHz           |
| High Range        | 8 912  | 1 782.4 MHz         | 9 387  | 1 877.4 MHz           |

#### 5.1.1.4 FDD reference test frequencies for Operating Band VI

| Test Frequency ID | UARFCN | Frequency of Uplink | UARFCN | Frequency of Downlink |
|-------------------|--------|---------------------|--------|-----------------------|
| Low Range         | 812    | 832.5 MHz           | 1 037  | 877.5 MHz             |
| Mid Range         | 4175   | 835.0MHz            | 4400   | 880.0 MHz             |
| High Range        | 837    | 837.5 MHz           | 1 062  | 882.5 MHz             |

# 5.1.2 TDD Mode Test frequencies

UTRA/TDD is designed to operate in one of three unpaired bands [12]. The reference test frequencies for the common test environment for each of the 3 operating bands are defined in the following tables:

#### 5.1.2.1 Standard TDD reference test frequencies (3.84 Mcps option)

|              | Ba                 | nd a        | Ba     | ınd b       | Band c |             |
|--------------|--------------------|-------------|--------|-------------|--------|-------------|
| Test         | UARFCN Frequency I |             | UARFCN | Frequency   | UARFCN | Frequency   |
| Frequency ID |                    | (UL and DL) |        | (UL and DL) |        | (UL and DL) |
| Low Range    | 9 513              | 1 902.6 MHz | 9 263  | 1 852.6 MHz | 9563   | 1912.6 MHz  |
| Mid Range    | 9 550              | 1 910 MHz   | 9 400  | 1 880 MHz   | 9600   | 1920 MHz    |
| High Range   | 9 587              | 1 917.4 MHz | 9 537  | 1 907.4 MHz | 9637   | 1927.4 MHz  |
| Low Range    | 10 063             | 2 012.6 MHz | 9 663  | 1 932.6 MHz |        |             |
| Mid Range    | 10 087             | 2 017.4 MHz | 9 800  | 1 960 MHz   |        |             |
| High Range   | 10 112             | 2 022.4 MHz | 9 937  | 1 987.4 MHz |        |             |

#### 5.1.2.2 Standard TDD reference test frequencies (1.28 Mcps option)

|              | Ba     | ınd a       | Ва     | and b       | Band c |             |
|--------------|--------|-------------|--------|-------------|--------|-------------|
| Test         | UARFCN | Frequency   | UARFCN | Frequency   | UARFCN | Frequency   |
| Frequency ID |        | (UL and DL) |        | (UL and DL) |        | (UL and DL) |
| Low Range    | 9504   | 1 900.8 MHz | 9254   | 1850.8 MHz  | 9554   | 1910.8 MHz  |
| Mid Range    | 9550   | 1 910 MHz   | 9400   | 1880 MHz    | 9600   | 1920 MHz    |
| High Range   | 9596   | 1 919.2 MHz | 9546   | 1909.2 MHz  | 9646   | 1929.2 MHz  |
| Low Range    | 10 054 | 2 010.8 MHz | 9654   | 1930.8 MHz  |        |             |
| Mid Range    | 10 087 | 2 017.4 MHz | 9800   | 1960 MHz    |        |             |
| High Range   | 10 121 | 2 024.2 MHz | 9946   | 1989.2 MHz  |        |             |

#### 5.2 Radio conditions

There are a number of radio propagation conditions defined in [2] for FDD mode and [5] for TDD mode, which may be required for a number of tests and hence can be considered as Common Conditions for FDD mode and TDD mode respectively.

NOTE: The System Simulator is required to support at least the normal Propagation Condition; support of the other propagation conditions is optional, depending on the specific test supported by the simulator.

#### 5.2.1 Normal Propagation Condition

This condition provides a connection between the System Simulator that is effectively free from Additive White Gaussian Noise, and where there are no fading or multipath effects. This condition will be used for Signalling tests.

#### 5.2.2 Static Propagation Condition

See [2] annex D for FDD.

For TDD mode, the propagation for the static performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this propagation model..

# 5.2.3 Multi-Path Fading Propagation Conditions

See [2] annex D for FDD and [5] annex D for TDD.

# 5.2.4 Moving Propagation Conditions

See [2] annex D for FDD. There are no currently defined Moving propagation conditions for TDD.

# 5.2.5 Birth-Death propagation conditions

See [2] annex D for FDD. There are no currently defined Birth-Death propagation conditions for TDD.

# 5.3 Standard test signals

Reference [11] and [12] for definitions of standard test signals.

# 5.4 Signal levels

The power levels given in the following clauses (5.4.1 and 5.4.2) apply for Signalling tests only. For RF tests power levels are given in [2] annex E for FDD and [5] annex E for TDD.

#### 5.4.1 Downlink Signal Levels

<FFS>

#### 5.4.2 Uplink Signal Levels

<FFS>

# 6 Reference System Configurations

This clause defines a number of Reference System Configurations which can be used for different tests.

#### 6.1 Simulated network environments

The UE will eventually have to operate in either single mode networks (FDD or TDD), dual mode networks (FDD+TDD), or inter-RAT networks (FDD or TDD + GSM).

The following tables list the default parameters for 1 to 8 cell environments for testing.

To simplify TTCN implementation the total number of simultaneous cells in intra-frequency, inter-frequency and inter-RAT cell information lists (SIB11) have been limited to 8 and a specific cell numbering scheme have been defined to associate cell identifiers with type of cell.

- Cell 1, Cell 2, Cell 3, Cell 7 and Cell 8 are associated with FDD/TDD cells using frequency f1;
- Cell 4, Cell 5 and Cell 6 are associated with FDD/TDD cells using frequency f2; and
- Cell 9 and Cell 10 are associated with GSM cells.

For FDD and TDD intra- and inter-frequency cell environment Cell 1 to Cell 8 are used.

For FDD/GSM inter-RAT cell environment Cell 1 to Cell 6, Cell 9 and Cell 10 are used.

In this clause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

# 6.1.0a Default Master Information Block and Scheduling Block messages

#### 6.1.0a.1 Grouping SIBs for testing

| Mandatory in 34.108 Used in Idle Mode |                        | MIB, SB1, (SB2), SIB1, SIB2, SIB3, SIB5, SIB7, SIB11 |  |
|---------------------------------------|------------------------|------------------------------------------------------|--|
|                                       | Used in Connected Mode | SIB4, SIB6, SIB12                                    |  |
| Mandatory for FDD CPCH                |                        | SIB8, SIB9                                           |  |
| Mandatory for FDD DRAC                |                        | SIB10                                                |  |
| Mandatory for TDD                     |                        | SIB14, SIB17                                         |  |
| Mandatory for LCS                     |                        | SIB15, SIB15.1, SIB15.2, SIB15.3                     |  |
| Mandatory for ANSI-41 system          |                        | SIB13, SIB13.1, SIB13.2, SIB13.3, SIB13.4            |  |
| Mandatory for InterSys HO             |                        | SIB16                                                |  |
| Mandatory for Cell reselection        |                        | SIB18                                                |  |

#### 6.1.0a.2 SIB configurations

Currently three SIB configurations are used, Configuration 1 is default for both UTRAN/FDD SYSTEM and UTRAN/FDD + GERAN SYSTEM, or both UTRAN/TDD SYSTEM and UTRAN/TDD + GERAN SYSTEM.

Configuration 2 is for test cases which need two S\_CCPCH or two PRACH. Configuration 3 is for inter-RAT handover test cases.

| Configuration 1 | MIB, SB1, SIB1, SIB2, SIB3, SIB4, SIB5, SIB6, SIB7, SIB11, SIB12, SIB18 |
|-----------------|-------------------------------------------------------------------------|
| Configuration 2 | MIB, SB1, SIB1, SIB2, SIB3, SIB4, SIB5, SIB7, SIB11, SIB12, SIB18       |
| Configuration 3 | MIB, SB1, SIB1, SIB2, SIB3, SIB4, SIB5, SIB7, SIB11, SIB16, SIB18       |

#### 6.1.0a.3 SIB default schedule

The SEG\_COUNT in the table specifies the maximum possible transport BCH blocks scheduled for broadcasting. The more contents a SIB has, the more transport BCH blocks are needed for broadcasting. In order to keep SIB repetition period, SIB\_REP, unchanged in different test cases, each specific SIB in the individual test cases after the PER encoding shall not exceed the SEG\_COUNT scheduled.

If the transport BCH blocks actually required for a SIB is less than the scheduled SEG\_COUNT, the no\_segment blocks shall be placed at the rest scheduled transport BCH blocks. In addition, the corresponding SEG\_COUNT IE value in MIB or in SB1 shall be set to the number of transport BCH blocks actually required.

Contents of Master Information Block PLMN type is the case of GSM-MAP

```
MIB value tag
Supported PLMN types
- PLMN type
                                               GSM-MAP
- PLMN identity
- MCC digit
                                               Set to the same Mobile Country Codes stored in the test
                                               USIM card (TS 34.108 clause 8.3.2.2 EF IMSI(IMSI)).
                                               Set to the same Mobile Network Codesstored in the test
 - MNC digit
                                               USIM card (TS 34.108 clause 8.3.2.2 EF IMSI(IMSI)).

Contents of System Information Block type 8, 9 (only for FDD)

This information is used for static CPCH in the cell, so this is not present.

Contents of System Information Block type 10 (only for FDD)

This information is used for DRAC, so this is not present.

Contents of System Information Block type 11 (FDD)

This is the default message content of SIB 11 for cell 1.

See sub-clause 6.1.4 for the difference in message contents of System Information Block type 11 (FDD) for cell 2 to 8.

## Contents of System Information Block type 16

| - Predefined RB configuration   | [FFS] |
|---------------------------------|-------|
| - Predefined TrCh configuration | [FFS] |
| - Predefined Phy configuration  | [FFS] |

## Contents of System Information Block type17 (3.84 Mcsps TDD and 1.28 Mcps TDD)

This system information block contains fast changing parameters for the configuration of the shared physical channels to be used in connected mode, so this is not present.

Contents of System Information Block type 18

| - Idle mode PLMN identities           |             |
|---------------------------------------|-------------|
| - PLMNs of intra-frequency cells list | Not present |
| - PLMNs of inter-frequency cells list | Not present |
| - PLMNs of inter-RAT cells list       | Not present |
| - Connected mode PLMN identities      | Not present |

# 6.1.1 SCCPCH configuration with Stand-alone SRB for PCCH in the first SCCPCH and Interactive/Background 32 kbps PS RAB + SRBs for CCCH/DCCH/BCCH in the second SCCPCH

Two SCCPCHs are used in this SYSTEM INFORMATION configuration. The first SCCPCH carries the PCH and the second SCCPCH carries the FACH for Interactive/Background 32 kbps PS RAB and the FACH for SRBs on CCCH/DCCH/BCCH.

This Reference System Configuration is the same as defined in chapter 6.1, except for the following SIBs.

# Contents of System Information Block type 5 (FDD)

6.1.2 SCCPCH configuration with Stand-alone SRB for PCCH in the first SCCPCH, RB for CTCH + SRBs for CCCH/BCCH in the second SCCPCH and Interactive/Background 32 kbps PS RAB + SRBs for CCCH/DCCH/BCCH in the third SCCPCH (FDD only)

Three SCCPCHs are used in this SYSTEM INFORMATION configuration. The first SCCPCH carries the PCH. The second SCCPCH carries the FACH for CTCH (Cell Broadcast Service) and the FACH for SRBs on CCCH/ BCCH for idle mode UEs. The third SCCPCH carries the FACH for Interactive/Background 32 kbps PS RAB and the FACH for SRBs on CCCH/ DCCH/ BCCH for connected mode UEs.

This Reference System Configuration is the same as defined in chapter 6.1, except for the following SIBs.

# 6.1.3 SCCPCH configuration with Stand-alone SRB for PCCH in the first SCCPCH and Interactive/Background 32 kbps PS RAB + SRBs for CCCH/DCCH/BCCH in the second and third SCCPCHs

Three SCCPCHs are used in this SYSTEM INFORMATION configuration. The first SCCPCH carries the PCH and both the second and third SCCPCHs carry the FACH for Interactive/Background 32 kbps PS RAB and the FACH for SRBs on CCCH/ DCCH/ BCCH.

This Reference System Configuration is the same as defined in chapter 6.1, except for the following SIBs. (SIB6 is not used in this configuration.)

### 6.1.4 Default parameters for 1 to 8 cell environments

Default settings for cell No.1 (FDD):

| Downlink input level         | Reference clause 6.10 Parameter Set        |
|------------------------------|--------------------------------------------|
| Uplink output power          | Minimum supported by the UE's power class. |
| PCCPCH/PCPICH carrier number | Reference clause 6.10 Parameter Set        |
| Cell Channel Description     |                                            |
| - Primary CPICH info         |                                            |
| - Primary scrambling code    | 100                                        |

Contents of System Information Block type 11 for cell No.1 (FDD)

See sub-clause 6.1.0b for contents of System Information Block type 11 (FDD) for cell 1.

Contents of System Information Block type 12 in connected mode for cell No.1 (FDD)

See sub-clause 6.1.0b for contents of System Information Block type 12 (FDD) for cell 1.

Default settings for cell No.1 (TDD):

| Downlink input level         | Reference clause 6 Parameter Set           |
|------------------------------|--------------------------------------------|
| Uplink output power          | Minimum supported by the UE's power class. |
| PCCPCH/PCPICH carrier number | Reference clause 6 Parameter Set           |
| Cell Channel Description     |                                            |
| - Primary CCPCH info         |                                            |
| - Cell parameters ID         | 0                                          |

Contents of System Information Block type 11 for cell No.1 (TDD)

See sub-clause 6.1.0b for contents of System Information Block type 11 (TDD) for cell 1.

Contents of System Information Block type 12 in connected mode for cell No.1 (TDD)

See sub-clause 6.1.0b for contents of System Information Block type 12 (TDD) for cell 1.

#### Cell No.2

The contents of SYSTEM INFORMATION BLOCK TYPE 1 to 16 messages for cell No.2 are identical to those of cell No.1 with the following exceptions:

| Cell identity | 0000 0000 0000 0000 0000 0010B |
|---------------|--------------------------------|
| URA identity  | 0000 0000 0000 0001B           |

### Default settings for cell No.2 (FDD):

| Downlink input level         | Reference clause 6.10 Parameter Set        |
|------------------------------|--------------------------------------------|
| Uplink output power          | Minimum supported by the UE's power class. |
| PCCPCH/PCPICH carrier number | Reference clause 6.10 Parameter Set        |

### Cell No.6

The contents of SYSTEM INFORMATION BLOCK TYPE 1 to 16 messages for cell No.6 are identical to those of cell No.4 with the following exceptions:

| Cell identity | 0000 0000 0000 0000 0000 0000 0110B |
|---------------|-------------------------------------|
| URA identity  | 0000 0000 0000 0011B                |

### Default settings for cell No.6 (FDD):

| Downlink input level         | Reference clause 6 Parameter Set           |
|------------------------------|--------------------------------------------|
| Uplink output power          | Minimum supported by the UE's power class. |
| PCCPCH/PCPICH carrier number | Reference clause 6 Parameter Set           |
| Cell Channel Description     |                                            |
| - Primary CPICH info         |                                            |
| - Primary scrambling code    | 350                                        |

### Cell No.9

Contents of System Information for cell No.9 (GSM)

See TS 51.010-1 [31], clause 10.1.2.

Default settings for cell No.9 (GSM):

See table 6.1.10

Cell No.10

Contents of System Information for cell No.10 (GSM)

See TS 51.010-1 [31], clause 10.1.2.

Default settings for cell No.10 (GSM):

See table 6.1.10

### Default Cell parameters Two PLMN in UTRAN test scenario

In this scenario two cell groups belong to two different PLMN, Cell 1,2,3,7,8 (for PLMN1) and Cell 4,5,6 (for PLMN2) shall be configured on two different frequencies.

The contents of SYSTEM INFORMATION BLOCK TYPE 1 to 16 messages for cell No.1 to 8 are identical to those of cell No.1-8 in subclause 6.1.4. Exceptions are found in SYSTEM INFORMATION BLOCK TYPE 11:

- SYSTEM INFORMATION BLOCK TYPE 11 for cell No.1, 2, 3, 7, 8 contains cell No.1, 2, 3, 7, 8 in Intrafrequency measurement system information, and cell No.4, 5, 6 in Inter-frequency measurement system information.
- SYSTEM INFORMATION BLOCK TYPE 11 for cell No.4,5,6 contains cell No.4,5,6 in Intra-frequency measurement system information, and cell No. 1, 2, 3, 7, 8 in Inter-frequency measurement system information.
- All other parameters in SYSTEM INFORMATION BLOCK TYPE 11 are set to identical to subclause 6.1.4.

Contents of System Information Block type 18 for cell No.1,2,3,7,8

| - Idle mode PLMN identities - PLMNs of intra-frequency cells list | Not Present  |
|-------------------------------------------------------------------|--------------|
| - PLMNs of inter-frequency cells list                             |              |
| - PLMN identity                                                   | Set to PLMN2 |
| - PLMNs of inter-RAT cells list                                   | Not present  |
| - Connected mode PLMN identities                                  | Not present  |

Contents of System Information Block type 18 for cell No.4,5,6

| Lella con a de Di MANI (de catitica   |              |
|---------------------------------------|--------------|
| - Idle mode PLMN identities           |              |
| - PLMNs of intra-frequency cells list | Not Present  |
| - PLMNs of inter-frequency cells list |              |
| - PLMN identity                       | Set to PLMN1 |
| - PLMNs of inter-RAT cells list       | Not present  |
| - Connected mode PLMN identities      | Not present  |

### Default Cell parameters Three PLMN in UTRAN test scenario

In this scenario three cell groups belong to three different PLMN, Cell 1, 2, 3 (for PLMN1), Cell 4, 5, 6 (for PLMN2) and Cell 7, 8 (for PLMN3) shall be configured on three different frequencies.

The contents of SYSTEM INFORMATION BLOCK TYPE 1 to 16 messages for cell No.1 to 8 are identical to those of cell No.1-8 in subclause 6.1.4. Exceptions are found in SYSTEM INFORMATION BLOCK TYPE 11:

- SYSTEM INFORMATION BLOCK TYPE 11 for cell No.1, 2, 3 contains cell No.1, 2, 3 in Intra-frequency measurement system information, and cell No.4, 5, 6, 7, 8 in Inter-frequency measurement system information.
- SYSTEM INFORMATION BLOCK TYPE 11 for cell No. 4, 5, 6 contains cell No. 4, 5, 6 in Intrafrequency measurement system information, and cell No. 1, 2, 3, 7, 8 in Inter-frequency measurement system information.
- SYSTEM INFORMATION BLOCK TYPE 11 for cell No. 7, 8 contains cell No. 7, 8 in Intra-frequency measurement system information, and cell No. 1, 2, 3, 4, 5, 6 in Inter-frequency measurement system information.
- All other parameters in SYSTEM INFORMATION BLOCK TYPE 11 are set to identical to subclause 6.1.4.

Contents of System Information Block type 18 for cell No.1,2,3,

| Not Present               |
|---------------------------|
| Set to PLMN2              |
| Set to PLMN2 Set to PLMN2 |
| Set to PLMN3              |
| Not present Not present   |
|                           |

Contents of System Information Block type 18 for cell No.4,5,6

|---------------------------------------|--------------|
| - PLMNs of intra-frequency cells list | Not Present  |
| - PLMNs of inter-frequency cells list |              |
| - PLMN identity                       | Set to PLMN1 |
| - PLMN identity                       | Set to PLMN1 |
| - PLMN identity                       | Set to PLMN1 |
| - PLMN identity                       | Set to PLMN3 |
| - PLMNs of inter-RAT cells list       | Not present  |
| - Connected mode PLMN identities      | Not present  |

Contents of System Information Block type 18 for cell No.7,8

| - Idle mode PLMN identities           |              |
|---------------------------------------|--------------|
| - PLMNs of intra-frequency cells list | Not Present  |
| - PLMNs of inter-frequency cells list |              |
| - PLMN identity                       | Set to PLMN1 |
| - PLMN identity                       | Set to PLMN1 |
| - PLMN identity                       | Set to PLMN1 |
| - PLMN identity                       | Set to PLMN2 |
| - PLMNs of inter-RAT cells list       | Not present  |
| - Connected mode PLMN identities      | Not present  |

# 6.1.5 Reference Radio Conditions for signalling test cases (FDD)

The following transmission parameters shall be used for signalling test cases only unless otherwise stated in the description of the individual test case.

Table 6.1.3 are the default settings for a non-suitable cell which is configured and always present whereas Table 6.1.4 is for a cell that is switched off. Cells configured according to Table 6.1.3 are for test cases in which it is necessary to make a cell unsuitable, and then subsequently make it suitable. This could be achieved by switching the cell off and then reconfiguration as in Table 6.1.4, but this takes a lot of time to do.

Table 6.1.1: Default settings for a serving cell in a single cell environment

| Parameter                    | Unit     | Cell 1       |  |
|------------------------------|----------|--------------|--|
| Cell type                    |          | Serving cell |  |
| UTRA RF Channel Number       |          | Channel 1    |  |
| Qqualmin                     | dB       | -24          |  |
| Qrxlevmin                    | dBm      | -81          |  |
| UE_TXPWR_MAX_RACH            | dBm      | 21           |  |
| CPICH Ec (see notes 1 and 2) | dBm/3.84 | -60          |  |
|                              | MHz      |              |  |

NOTE 1: The power level is specified in terms of CPICH\_Ec instead of CPICH\_RSCP as RSCP is a receiver measurement and only CPICH\_Ec can be directly controlled by the SS.

NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2 and TS 25.133, 8.1.2.2.1.

Table 6.1.2: Default settings for a serving cell and a suitable neighbour cell in a multi-cell environment

| Parameter                    | Unit            | Cell 1       | Cell 2                                               | Cell 4                                               |
|------------------------------|-----------------|--------------|------------------------------------------------------|------------------------------------------------------|
| Cell type                    |                 | Serving cell | Suitable<br>neighbour<br>intra-<br>frequency<br>cell | Suitable<br>neighbour<br>inter-<br>frequency<br>cell |
| UTRA RF Channel Number       |                 | Channel 1    | Channel 1                                            | Channel 2                                            |
| Qqualmin                     | dB              | -24          | -2                                                   | 24                                                   |
| Qrxlevmin                    | dBm             | -81          | -81                                                  |                                                      |
| UE_TXPWR_MAX_RACH            | dBm             | 21           | 21                                                   |                                                      |
| CPICH Ec (see notes 1 and 2) | dBm/3.84<br>MHz | -60          | -7                                                   | 0                                                    |

NOTE 1: The power level is specified in terms of CPICH\_Ec instead of CPICH\_RSCP as RSCP is a receiver measurement and only CPICH\_Ec can be directly controlled by the SS. NOTE 2: Both cells fulfil TS 25.304, 5.2.3.1.2 and TS 25.133, 8.1.2.2.1.

Table 6.1.3: Default settings for a non-suitable cell

| Parameter         | Unit     | Level |
|-------------------|----------|-------|
| Qqualmin          | dB       | -24   |
| Qrxlevmin         | dBm      | -81   |
| UE_TXPWR_MAX_RACH | dBm      | 21    |
| CPICH_Ec          | dBm/3.84 | -90   |
|                   | MHz      |       |

NOTE 1: The power level is specified in terms of CPICH\_Ec instead of CPICH\_RSCP as RSCP is a receiver measurement and only CPICH\_Ec can be directly controlled by the SS

NOTE 2: The cell is not suitable according to TS 25.304, 5.2.3.1.2

Table 6.1.4: Default settings for a non-suitable "Off" cell

| Parameter         | Unit            | Level  |
|-------------------|-----------------|--------|
| Qqualmin          | dB              | -24    |
| Qrxlevmin         | dBm             | -81    |
| UE_TXPWR_MAX_RACH | dBm             | 21     |
| CPICH_Ec          | dBm/3.84        | ≤ -122 |
|                   | MH <sub>2</sub> |        |

NOTE 1: The power level is specified in terms of CPICH\_Ec instead of CPICH\_RSCP as RSCP is a receiver measurement and only CPICH\_Ec can be directly controlled by the SS.

NOTE 2: The cell is not suitable according to TS 25.304, 5.2.3.1.2.

Table 6.1.5: Default power levels of physical channels relative to CPICH\_Ec

| Unit | Level<br>Idle mode   | Level<br>Connected mode |
|------|----------------------|-------------------------|
| dB   | (NOTE)               | -5                      |
| dB   |                      | -2                      |
| dB   |                      | -2                      |
| dB   |                      | -5                      |
| dB   |                      | -2                      |
| dB   |                      | -5                      |
|      | dB<br>dB<br>dB<br>dB | Idle mode   dB          |

NOTE: This shall be less than –122 dBm to ensure the channel is considered as "off".

# 6.1.6 Reference Radio Conditions for signalling test cases (TDD)

The following transmission parameters shall be used for signalling test cases only unless otherwise stated in the description of the individual test case.

Table 6.1.6: Default settings for a serving cell in a single cell environment

| Parameter                                                  | Unit | Cell 1       |
|------------------------------------------------------------|------|--------------|
| Cell type                                                  |      | Serving cell |
| UTRA RF Channel Number                                     |      | Channel 1    |
| Qrxlevmin                                                  | dBm  | -81          |
| UE_TXPWR_MAX_RACH                                          | dBm  | 21           |
| PCCPCH RSCP                                                | dBm  | -60          |
| NOTE: The cell fulfils TS 25.304, 5.2.3.1.2 and TS 25.123. |      |              |

Table 6.1.7: Default settings for a serving cell and a suitable neighbour cell in a multi-cell environment

| Parameter                                                   | Unit | Cell 1       | Cell 2                                               | Cell 4                                               |
|-------------------------------------------------------------|------|--------------|------------------------------------------------------|------------------------------------------------------|
| Cell type                                                   |      | Serving cell | Suitable<br>neighbour<br>intra-<br>frequency<br>cell | Suitable<br>neighbour<br>inter-<br>frequency<br>cell |
| UTRA RF Channel Number                                      |      | Channel 1    | Channel 1                                            | Channel 2                                            |
| Qrxlevmin                                                   | dBm  | -81          | -81 -81                                              |                                                      |
| UE_TXPWR_MAX_RACH                                           | dBm  | 21           | 21                                                   |                                                      |
| PCCPCH RSCP                                                 | dBm  | -60          | -7                                                   | 0                                                    |
| NOTE: Both cells fulfil TS 25.304, 5.2.3.1.2 and TS 25.123. |      |              |                                                      |                                                      |

Table 6.1.8: Default settings for a non-suitable cell

| Parameter                                                        | Unit | Level |
|------------------------------------------------------------------|------|-------|
| Qrxlevmin                                                        | dBm  | -81   |
| UE_TXPWR_MAX_RACH                                                | dBm  | 21    |
| PCCPCH RSCP                                                      | dBm  | -91   |
| NOTE: The cell is not suitable according to TS 25.304, 5.2.3.1.2 |      |       |

Table 6.1.9: Default settings for a non-suitable "Off" cell

| Parameter                                                         | Unit | Level  |
|-------------------------------------------------------------------|------|--------|
| Qrxlevmin                                                         | dBm  | -81    |
| UE_TXPWR_MAX_RACH                                                 | dBm  | 21     |
| PCCPCH RSCP                                                       | dBm  | ≤ -110 |
| NOTE: The cell is not suitable according to TS 25.304, 5.2.3.1.2. |      |        |

# 6.1.7 Reference Radio Conditions for signalling test cases (GSM)

The following transmission parameters shall be used for signalling test cases only unless otherwise stated in the description of the individual test case.

Table 6.1.10: Default settings for a serving cell and a suitable neighbour cell in a multi-cell environment

| Parameter                                                           | Unit | Cell 9                                                                     | Cell 10                 |
|---------------------------------------------------------------------|------|----------------------------------------------------------------------------|-------------------------|
| Cell type                                                           |      | Serving cell                                                               | Suitable neighbour cell |
| GSM RF Channel Number                                               |      | Channel 1                                                                  | Channel 2               |
| Base transceiver Station<br>Identity Code (BSIC)                    |      | BSIC1                                                                      | BSIC2                   |
| Qrxlevmin                                                           | dBm  | -81                                                                        | -81                     |
| MS_TXPWR_MAX_CCH                                                    | dBm  | According to maximum output power for the power class of the MS under test |                         |
| RF level                                                            | dBm  | -48                                                                        | -54                     |
| NOTE: Both cells fulfil TS 25.304, 5.2.6.1.4 and TS 25.133, 8.1.2.5 |      |                                                                            |                         |

Table 6.1.11: Default settings for a non-suitable cell

| Parameter                                                          | Unit | Level                                                                      |
|--------------------------------------------------------------------|------|----------------------------------------------------------------------------|
| Qrxlevmin                                                          | dBm  | -81                                                                        |
| MS_TXPWR_MAX_CCH                                                   | dBm  | According to maximum output power for the power class of the MS under test |
| RF level dBm -90                                                   |      |                                                                            |
| NOTE 1: The cell is not suitable according to TS 25.304, 5.2.6.1.4 |      |                                                                            |

# 6.2 Number of neighbour cells

The options for the number of neighbour cells (ie the total number of active cells in the simulated network) are given below. See clause 6.1 for cell configurations.

### 6.2.1 Basic Network

| Number of Cells | Use of Network Configuration                             |
|-----------------|----------------------------------------------------------|
| 1               | Basic UE registration; RRC Connection Establishment and  |
|                 | Release; operation of dedicated channels in non-handover |
|                 | modes; general RF and EMC testing                        |

# 6.2.2 Soft Handover Network (FDD)

| Number of Cells | Use of Network Configuration/Constraints                                                                                                                                                        |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | Can be used in place of basic network, plus offering operation of dedicated channels in 2 way soft handover or in 2 way SSDT handover for RF or signalling tests; simple cell reselection tests |

### 6.2.3 Hard Handover Network

| Number of Cells | Use of Network Configuration                         |
|-----------------|------------------------------------------------------|
| 2               | Can be used in place of basic network, plus offering |
|                 | operation in 2 cell hard handover (inter-frequency)  |

## 6.2.4 'Roaming' Network

| Number of Cells | Use of Network Configuration                                                  |  |  |  |
|-----------------|-------------------------------------------------------------------------------|--|--|--|
| 7               | This configuration is intended to provide the capability for                  |  |  |  |
|                 | extensive cell selection and reselection testing, as defined                  |  |  |  |
|                 | under Idle Mode Testing.                                                      |  |  |  |
|                 | It is <ffs> if 7 is the correct number of cells and also <ffs> is</ffs></ffs> |  |  |  |
|                 | the number of separate RF channels to be supported by the                     |  |  |  |
|                 | 'Roaming Network'                                                             |  |  |  |

### 6.3 Cell/BS codes etc

See clause 6.1.

## 6.4 Routing/location area

See clause 6.1.

## 6.5 Network options settings

See clause 6.1.

#### 6.6 Power control mode

#### 6.6.1 Downlink Power Control

#### 6.6.1.1 Outer Loop Power Control

This is used to set the SIR requirements from the given BER/BLER requirements for the dedicated channel – the reference configuration is for the BER/BLER and SIR requirements to be fixed, ie Outer Loop Power Control is disabled.

#### 6.6.1.2 Inner Loop Power Control

The inner loop power control adjusts the power of the dedicated channel to meet the SIR requirements. The reference condition is for the Inner Loop Power Control to be disabled.

## 6.6.2 Uplink Power Control

#### 6.6.2.1 Outer Loop Power Control

This is used to set the SIR requirements from the given BER/BLER requirements for the dedicated channel – the reference configuration is for the BER/BLER and SIR requirements to be fixed, ie Outer Loop Power Control is disabled.

#### 6.6.2.2 Inner Loop Power Control (FDD)

The inner loop power control adjusts the power of the dedicated channel to meet the SIR requirements.

## 6.7 Tx Diversity modes

The reference settings for Tx Diversity Mode shall be

## 6.7.1 Non-Diverse Operation

DL Transmit Diversity shall be disabled on all cells in the simulated network

### 6.7.2 Diverse Operation

#### 6.7.2.1 Diverse Operation (FDD mode)

The diversity options applied to the DL channels shall be as below for all cells in the simulated network.

| Channel | Open loc | Closed loop |      |
|---------|----------|-------------|------|
|         | TSTD     | STTD        | Mode |
| P-CCPCH | _        | X           | _    |
| SCH     | X        | -           | _    |
| S-CCPCH | _        | X           | _    |
| DPCH    | _        | Χ           | -    |
| PICH    | _        | X           | _    |
| AICH    | _        | X           | _    |

#### 6.7.2.2 Diverse Operation (TDD mode)

The diversity options applied to the DL channels shall be as below for all cells in the simulated network

#### 6.7.2.2.1 3.84.Mcps option

Table 6.7.1: Application of Tx diversity schemes on downlink physical channel types in 3.84Mcps
TDD
"X" – can be applied, "-" – must not be applied

| Physical channel type | Open loop TxDiversity    |   | Closed loop TxDiversity |
|-----------------------|--------------------------|---|-------------------------|
|                       | TSTD SCTD <sup>(*)</sup> |   |                         |
| P-CCPCH               | -                        | X | _                       |
| S-CCPCH               |                          | Х |                         |
| SCH                   | Χ                        | _ | _                       |
| DPCH                  | ı                        | _ | X                       |
| PDSCH                 | 1                        | X | X                       |
| PICH                  | -                        | X | _                       |

(\*) Note: SCTD may only be applied to physical channels when they are allocated to beacon locations.

#### 6.7.2.2.2 1.28 Mcps option

Table 6.7.2: Application of Tx diversity schemes on downlink physical channel types in 1.28Mcps TDD

"X" - can be applied, "-" - must not be applied

| Physical channel type | Open loop TxDiversity |          | Closed loop TxDiversity |
|-----------------------|-----------------------|----------|-------------------------|
|                       | TSTD                  | SCTD (*) |                         |
| P-CCPCH               | Χ                     | Х        | _                       |
| S-CCPCH               | X                     | X        | _                       |
| DwPCH                 | Χ                     | _        | _                       |
| DPCH                  | Χ                     | _        | X                       |
| PDSCH                 | Χ                     | X        | X                       |
| PICH                  | Χ                     | X        | -                       |
|                       |                       |          |                         |

(\*) Note: SCTD may only be applied to physical channels when they are allocated to beacon locations.

## 6.8 Compressed Mode Parameters

In this clause, Parameters for reference compressed mode patterns are defined which are used in signalling test cases such as inter frequency FDD measurement, inter frequency TDD measurement and inter RAT measurement in specified [1]. These parameters are defined in [30] for measurement performance tests.

Depending on UE capability, there are four methods constructed of three types using of compressed mode such as UL only, DL only and both UL and DL, and using without application of compressed for the above measurement purposes. As test requirement is the same even if the test methods are different, ICS/IXIT statement is applied to the test cases so that the test procedure and specific message contents specified in [1] can be distinguished.

## 6.8.1 Single compressed mode pattern

Configuration parameters in single compressed mode pattern for one type of measurement objects are described in the following sub-clauses.

#### 6.8.1.1 Inter Frequency FDD measurement

The configuration parameters for an inter frequency FDD measurement is shown in table 6.8.1.

Table 6.8.1: Compressed mode parameters (Inter Frequency FDD measurement)

| Parameter                               | Value                 | Note                       |
|-----------------------------------------|-----------------------|----------------------------|
| TGSN (Transmission Gap Starting Slot    | 4                     |                            |
| Number)                                 |                       |                            |
| TGL1 (Transmission Gap Length 1)        | 7                     |                            |
| TGL2 (Transmission Gap Length 2)        | -                     | Only one gap in use.       |
| TGD (Transmission Gap Distance)         | undefined             |                            |
| TGPL1 (Transmission Gap Pattern         | 3                     |                            |
| Length)                                 |                       |                            |
| TGPL2 (Transmission Gap Pattern         | -                     | Only one pattern in use.   |
| Length)                                 |                       |                            |
| TGCFN (Transmission Gap Connection      | (Current CFN + (256 – |                            |
| Frame Number):                          | TTI/10msec))mod 256   |                            |
| UL/DL compressed mode selection         | DL, UL or DL & UL     | 3 configurations possible. |
|                                         | 05/0                  | DL, UL or both DL and UL   |
| UL compressed mode method               | SF/2                  |                            |
| DL compressed mode method               | SF/2                  |                            |
| Scrambling code change                  | No                    |                            |
| RPP (Recovery period power control      | 0                     |                            |
| mode)                                   |                       |                            |
| ITP (Initial transmission power control | 0                     |                            |
| mode)                                   |                       |                            |

#### 6.8.1.2 Inter Frequency TDD measurement

The configuration parameters for an inter frequency TDD measurement is shown in table 6.8.2.

Table 6.8.2: Compressed mode parameters (Inter Frequency TDD measurement)

| Parameter                               | Value                 | Note                       |
|-----------------------------------------|-----------------------|----------------------------|
| TGSN (Transmission Gap Starting Slot    | 10                    |                            |
| Number)                                 |                       |                            |
| TGL1 (Transmission Gap Length 1)        | 10                    |                            |
| TGL2 (Transmission Gap Length 2)        | -                     | Only one gap in use.       |
| TGD (Transmission Gap Distance)         | undefined             |                            |
| TGPL1 (Transmission Gap Pattern         | 11                    |                            |
| Length)                                 |                       |                            |
| TGPL2 (Transmission Gap Pattern         | -                     | Only one pattern in use.   |
| Length)                                 |                       |                            |
| TGCFN (Transmission Gap Connection      | (Current CFN + (256 – |                            |
| Frame Number):                          | TTI/10msec))mod 256   |                            |
| UL/DL compressed mode selection         | DL, UL or DL & UL     | 3 configurations possible. |
|                                         |                       | DL, UL or both DL and UL   |
| UL compressed mode method               | SF/2                  |                            |
| DL compressed mode method               | Puncturing            |                            |
| Scrambling code change                  | No                    |                            |
| RPP (Recovery period power control      | 0                     |                            |
| mode)                                   |                       |                            |
| ITP (Initial transmission power control | 0                     |                            |
| mode)                                   |                       |                            |

## 6.8.1.3 Inter RAT measurement (GSM - Carrier RSSI)

The configuration parameters for an Inter RAT measurement (GSM – Carrier RSSI) is shown in table 6.8.3.

Table 6.8.3: Compressed mode parameters (Inter RAT measurement – GSM Carrier RSSI)

| Parameter                               | Value                 | Note                       |
|-----------------------------------------|-----------------------|----------------------------|
| TGSN (Transmission Gap Starting Slot    | 4                     |                            |
| Number)                                 |                       |                            |
| TGL1 (Transmission Gap Length 1)        | 7                     |                            |
| TGL2 (Transmission Gap Length 2)        | -                     | Only one gap in use.       |
| TGD (Transmission Gap Distance)         | undefined             |                            |
| TGPL1 (Transmission Gap Pattern         | 12                    |                            |
| Length)                                 |                       |                            |
| TGPL2 (Transmission Gap Pattern         | -                     | Only one pattern in use.   |
| Length)                                 |                       |                            |
| TGCFN (Transmission Gap Connection      | (Current CFN + (256 – |                            |
| Frame Number):                          | TTI/10msec))mod 256   |                            |
| UL/DL compressed mode selection         | DL, UL or DL & UL     | 3 configurations possible. |
|                                         |                       | DL, UL or both DL and UL   |
| UL compressed mode method               | SF/2                  |                            |
| DL compressed mode method               | SF/2                  |                            |
| Scrambling code change                  | No                    |                            |
| RPP (Recovery period power control      | 0                     |                            |
| mode)                                   |                       |                            |
| ITP (Initial transmission power control | 0                     |                            |
| mode)                                   |                       |                            |

## 6.8.1.4 Inter RAT measurement (GSM – Initial BSIC Identification)

The configuration parameters for an inter frequency RAT measurement ( GSM – Initial BSIC Identification ) is shown in table 6.8.4.

Table 6.8.4: Compressed mode parameters (Inter RAT measurement – GSM Initial BSIC Identification)

| Parameter                               | Value                 | Note                       |
|-----------------------------------------|-----------------------|----------------------------|
| TGSN (Transmission Gap Starting Slot    | 4                     |                            |
| Number)                                 |                       |                            |
| TGL1 (Transmission Gap Length 1)        | 7                     |                            |
| TGL2 (Transmission Gap Length 2)        | -                     | Only one gap in use.       |
| TGD (Transmission Gap Distance)         | undefined             |                            |
| TGPL1 (Transmission Gap Pattern         | 8                     |                            |
| Length)                                 |                       |                            |
| TGPL2 (Transmission Gap Pattern         | -                     | Only one pattern in use.   |
| Length)                                 |                       |                            |
| TGCFN (Transmission Gap Connection      | (Current CFN + (256 – |                            |
| Frame Number):                          | TTI/10msec))mod 256   |                            |
| UL/DL compressed mode selection         | DL, UL or DL & UL     | 3 configurations possible. |
|                                         |                       | DL, UL or both DL and UL   |
| UL compressed mode method               | SF/2                  |                            |
| DL compressed mode method               | SF/2                  |                            |
| Scrambling code change                  | No                    |                            |
| RPP (Recovery period power control      | 0                     |                            |
| mode)                                   |                       |                            |
| ITP (Initial transmission power control | 0                     |                            |
| mode)                                   |                       |                            |

### 6.8.1.5 Inter RAT measurement (GSM – BSIC re-confirmation)

The configuration parameters for an inter RAT measurement (GSM – BSIC re-confirmation) is shown in table 6.8.5.

Table 6.8.5: Compressed mode parameters (Inter RAT measurement – GSM BSIC re-confirmation)

| Parameter                               | Value                 | Note                       |
|-----------------------------------------|-----------------------|----------------------------|
| TGSN (Transmission Gap Starting Slot    | 4                     |                            |

## 6.8.2 Multiple compressed mode patterns

Configuration parameters in multiple compressed mode patterns for several types of measurement objects are described in the following sub-clauses.

#### 6.8.2.1 Inter RAT measurement GSM

The configuration parameters for an inter RAT measurement (GSM – Carrier RSSI, Initial BSIC Identification and BSIC Re-confirmation) is shown in table 6.8.6.

Table 6.8.6: Compressed mode parameters (Inter RAT measurement – GSM Carrier RSSI & Initial BSIC identification & BSIC re-confirmation)

| Parameter                                         | GSM Carrier<br>RSSI                                 | GSM Initial<br>BSIC<br>identification               | GSM BSIC re-<br>confirmation                        | Note                                                         |

## 6.9 BCCH parameters

See clause 6.1.

# 6.10 Reference Radio Bearer configurations used in Radio Bearer interoperability testing

The reference radio bearer configurations are typical configurations of the radio interface. This sub-set of the mandatory set of radio bearer configurations supported by the UE is intended to be used as test configurations for testing of the UE. The purpose of the reference radio bearer configurations is to ensure interoperability of UE's in different regions and networks.

The reference radio bearer configurations are used in the radio bearer interoperability test cases, clause 14 of TS 34.123-1 [1]. The reference radio bearer configurations are also intended to be the first choice for other test cases where a radio bearer configuration is needed. For test cases requiring alternative configurations not provided by the reference radio bearer configurations then these specific radio bearer configurations are either specified in the actual test case itself; or in case the configurations are used by more than one test case then these common radio bearer configurations are specified in clause 6.11 of the present document.

NOTE If not specifically specified then the mid-value of the RM attribute value range as specified by the actual reference radio bearer configuration shall be applied for testing.

#### 6.10.1 QoS Architecture and RAB attributes

From a user point-of-view services are considered end-to-end, this means from a Terminal Equipment (TE) to another TE. An End-to-End Service may have a certain Quality of Service (QoS) which is provided for the user through the different networks. In UMTS, it is the UMTS Bearer Service that provides the requested QoS through the use of different QoS classes as defined in TS 23.107.

The UMTS Bearer Service consists of two parts, the Radio Access Bearer Service, RAB, and the Core Network Bearer Service. The Radio Access Bearer Service is realised by a Radio Bearer Service and an Iu-Bearer Service. The relationship between the services is illustrated in figure 6.10.1.1.

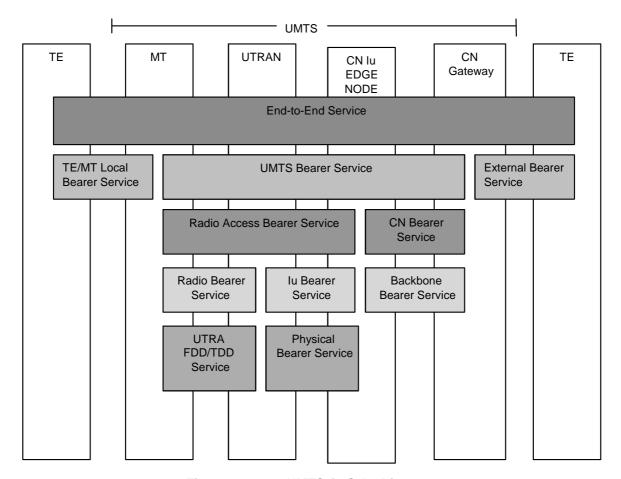

Figure 6.10.1.1: UMTS QoS Architecture

The Radio Access Bearer Service is characterised by a number of attributes such as Traffic class, Maximum bit rate, Guaranteed bit rate, SDU error ratio, Residual BER, Transfer Delay etc. As a first approach the four following attributes have been considered to come up with the parameter settings in clause 6.10.2.4 for FDD mode and 6.10.3.4 for TDD mode:

- Traffic class:
- SSD:
- Maximum bit rate;
- Residual BER.

The Traffic classes are explained in table 6.10.1.1. The Maximum bit rate has been considered at RLC layer and Physical Layer for the acknowledged and unacknowledged modes respectively. The Residual BER is understood as BER at RLC layer and Transport BLER for the acknowledged and unacknowledged modes respectively.

NOTE: The maximum bit rate in 6.10.2.4 for FDD mode and 6.10.3.4 for TDD mode is one of the RAB attribute as described above. For Interactive/Background PS RABs, however, the maximum bit rate of Radio Bearer can be lower than the maximum bit rate of RAB attributes due to radio resource management. Bit rates of Interactive/Background PS RABs described in 6.10.2.4 for FDD mode and 6.10.3.4 for TDD mode may represent the maximum bit rate of Radio Bearer taking account into this management.

Traffic class **Conversational class** Streaming class Interactive class **Background** Background best conversational RT streaming RT Interactive best effort effort Fundamental Preserve time relation Preserve time Request response Destination is not characteristics (variation) between relation (variation) expecting the pattern information entities of between information data within a Preserve payload the stream entities of the stream certain time content (i.e. some but Conversational pattern Preserve constant delay) (stringent and low payload content delay) Example of the speech, video, ... facsimile (NT) Web browsing background application download of streaming audio and emails video

Table 6.10.1.1: Traffic classes

## 6.10.2 RAB and signalling RB for FDD

#### 6.10.2.1 RABs and signalling RBs

In the following clauses, the typical parameter sets are presented for reference RABs, signalling RBs and important combinations of them. The data rate given for each RAB is the maximum data rate that can be supported by that RAB.

NOTE: The granularity for each RAB needs to be clarified.

Table 6.10.2.1.1: Prioritised RABs.

| Conversational   Speech   UL:12.2 DL:12.2   CS   R99                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | #  | Traffic class [15]        | SSD [15]   | Max. rate, kbps   | CS/PS | Version |

#### 6.10.2.2 Combinations of RABs and Signalling RBs

In the present document, physical channel parameters for following combinations of RABs and signalling RBs on a CCTrCH are described.

NOTE: It is understood that for speech service the AMR mode may be operated asymmetrically for the uplink and downlink.

#### Combinations on DPCH

- 1) Stand-alone UL:1.7 DL:1.7 kbps SRBs for DCCH.
- 2) Stand-alone UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 3) Stand-alone UL:13.6 DL:13.6 kbps SRBs for DCCH.
- Conversational / speech / UL:12.2 DL:12.2 kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 4a) Conversational / speech / UL:(12.2 7.95 5.9 4.75) DL:(12.2 7.95 5.9 4.75) kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 5) Conversational / speech / UL:10.2 DL:10.2 kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 5a) Conversational / speech / UL:(10.2, 6.7, 5.9, 4.75) DL:(10.2, 6.7, 5.9, 4.75) kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 6) Conversational / speech / UL:7.95 DL:7.95 kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 7) Conversational / speech / UL:7.4 DL:7.4 kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 7a) Conversational / speech / UL:(7.4, 6.7, 5.9, 4.75) DL:(7.4, 6.7, 5.9, 4.75) kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 8) Conversational / speech / UL:6.7 DL:6.7 kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 9) Conversational / speech / UL:5.9 DL:5.9 kbps / CS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH.
- 10) Conversational / speech / UL:5.15 DL:5.15 kbps / CS RAB + UL:1.7 DL:1.7 kbps SRBs for DCCH.
- 11) Conversational / speech / UL:4.75 DL:4.75 kbps / CS RAB + UL:1.7 DL:1.7 kbps SRBs for DCCH.

#### 6.10.2.3 Example of linkage between RABs and services

RABs, which are included in the present document, can provide the services as shown in table 6.10.1.1. Furthermore, the required BER for each RAB, which is assumed in the present document, is shown in table 6.10.2.3.1.

Table 6.10.2.3.1: Example of linkage between RABs and services

|                              | F        | RAB                          |       | Residual                                                           | Services                              |

NOTE 1: The TrCH corresponding to RAB subflow #1 should be used as the guiding TrCH, (see clause 4.3 in TS 25.212).

NOTE 2: CRC parity bits are to be attached to RAB subflow#1 any time since number of TrBlks are 1 even if there is no data on RAB subflow#1 (see clause 4.2.1.1 in TS 25.212).

## 6.10.3 RAB and signalling RB for TDD

## 6.10.3.1 RABs and signalling RBs

In the following clauses, the typical parameter sets are presented for reference RABs, signalling RBs and important combinations of them. The data rate given for each RAB is the maximum data rate that can be supported by that RAB.

NOTE: The granularity for each RAB needs to be clarified.

Table 6.10.3.1.1: Prioritised RABs.

| #   | Traffic class <sup>[3]</sup> SSD <sup>[3]</sup> Max. rate, kbps |         | CS/PS                                                     |    |

Table 6.10.3.1.2: Signalling RBs

## 6.10.3.2 Combinations of RABs and Signalling RBs

DL:16

In the present document, physical channel parameters for following combinations of RABs and signalling RBs on a CCTrCH are described.

NOTE: It is understood that for speech service the AMR mode may be operated asymmetrically for the uplink and downlink.

#### Combinations on DPCH

1) Stand-alone UL:1.7 DL:1.7 kbps SRBs for DCCH.

## 6.10.3.3 Example of linkage between RABs and services

RABs, which are included in the present document, can provide the services as shown in table 6.10.1.1: Traffic classes. Furthermore, the required BER for each RAB, which is assumed in the present document, is shown in table 6.10.3.3.1.

Table 6.10.3.3.1: Example of linkage between RABs and services

| RAB                          |                    |                              |       | Residual                                                           | Comicae                                                      |
